Instruction Level Parallelism

Dynamic Scheduling

Prof. Mokhtar Aboelaze

Parts of these slides are taken from Notes by
Prof. David Patterson (UCB)

Fall 08

CSE4201

Outline

- **Data dependence and hazards**
- **Exposing parallelism (loop unrolling and scheduling)**
- **Reducing branch costs (prediction)**
- **Dynamic scheduling**
- **Speculation**
- **Multiple issue and static scheduling**
- **Advanced techniques**
- **Example**

Fall 08

CSE4201

Introduction

- In dynamic scheduling, the hardware rearranges the instruction execution to reduce stalls.
- Can handle cases where dependence is not known during compile time (memory reference).
- Simplifies the compiler
- Can tolerate unpredictable cases (cache miss).
- Speculation is based on dynamic scheduling.
- Can allow code compiled and for another pipeline to run efficiently on any pipeline

Fall 08

CSE4201

Dynamic Scheduling – The idea

- DIVD F0, F2, F4
ADDD F10, F0, F8
SUBD F12, F8, F14
- SUB can not be issued because of the dependence of ADD on DIV, although there is no data dependence to prevent issuing it.
- In a classical pipeline, structural and data hazard are checked in the ID stage.
- Here we must separate between checking for structural hazards, and waiting for the absence of data hazard.
- In-order issue, but instructions starts executions soon as its data operands are available.

Fall 08

CSE4201

Dynamic Scheduling – The Idea

◦ Will distinguish when an instruction *begins execution* and when it *completes execution*; between 2 times, the instruction is *in execution*

◦ May create WAR and WAW hazards

DIV.D F0, F2, F4

ADD.D F6, F0, F8

SUB.D F8, F10, F16

MUL.D F6, F10, F8

◦ Exceptions?

Tomasulo's Algorithm – The Idea

◦ Developed by Robert Tomasulo for the IBM 360/91.

◦ Main objective is to get good performance without the need to a very specialized compilers.

◦ It tracks when operands for instructions are available to minimize RAW hazard.

◦ It uses register renaming to avoid WAR and WAW hazards.

◦ It is employed in many modern processors although with some variations.

Tomasulo's Algorithm – The Idea

	◦ DIV.D F0,F2,F4	
Anti	◦ ADD.D F6,F0,F8	
	◦ S.D F6,0(R1)	
	◦ SUB.D F8,F10,F14	
	◦ MUL.D F6,F10,F8	◦ DIV.D F0,F2,F4
		◦ ADD.D S,F0,F8
		◦ S.D S0(R1)
		◦ SUB.D S,F10,F14
		◦ MUL.D F6,F10,T

This could be done by the compiler, what if intervening branches.

In Tomasulo's this is done by using reservation stations

Fall 08

CSE4201

Tomasulo's Algorithm

- Control & buffers distributed with Function Units (FU)
 - FU buffers called "reservation stations"; have pending operands
- Registers in instructions replaced by values or pointers to reservation stations (RS); called register renaming ;
 - Renaming avoids WAR, WAW hazards
 - More reservation stations than registers at least for 360/91, so can do optimizations compilers can't
- Results to FU from RS, not through registers, over Common Data Bus that broadcasts results to all FUs
 - Avoids RAW hazards by executing an instruction only when its operands are available

Fall 08

CSE4201

Load and Stores treated as FUs with RSs as well

Tomasulo's Algorithm

- RS fetches operands as soon as they are available (no need to read them from a register).
- Pending instructions designate the RS's that will provide their inputs.
- When successive writes to the same register, only the last one is actually written to the register.
- Common data bus CDB is used to bypass registers in operand fetching.

Fall 08

CSE4201

Tomasulo's algorithm in MIPS

Fall 08

CSE4201

Tomasulo's Algorithm

Stages

1. **Issue**— AKA **dispatch** get instruction from FP Instruction Queue (FIFO)
 - If no empty reservation station, stall.
 - If reservation station free (no structural hazard), send the instruction (issue) to the station.
 - If operands ready (in register), send them else keep track of the reservation station that will produce them (renaming).

Fall 08

CSE4201

Tomasulo's Algorithm

2. **Execute**— AKA **execute** operate on operands (EX)

When both operands ready then execute; if not ready, watch Common Data Bus for result (RAW)

What if 2 instructions became ready in the same cycle?

Load/store require 2-step execution, calculating effective address and accessing memory.

Effective address is calculated and store in the load/store queue, maintained in a program order through the effective address calculation.

To preserve exception behavior, no instruction is allowed to execute until all previous branches are resolved. If a processor records the exception not raise, instruction can execute but no write-back

Fall 08

CSE4201

Tomasulo's Algorithm

3. Write result—finish execution (WB)

- Write on Common Data Bus to all awaiting units;
mark reservation station available
- Normal data bus: data + destination (“go to” bus)
- Common data bus: data + source (“come from” bus)
 - 64 bits of data + 4 bits of Functional Unit source address
 - Write if matches expected Functional Unit (produces result)

Fall 08

CSE4201

Reservation Station

Op: Operation to perform in the unit (e.g., + or -)

V_j, V_k: Value of Source operands

- Store buffers has V field, result to be stored

Q_j, Q_k: Reservation stations producing source registers (value to be written)

- Note: Q_j, Q_k=0 => ready
- Store buffers only have Q_j for RS producing result

A: Used to hold info for the load store (initially immediate, then effective address)

Busy: Indicates reservation station or FU is busy

Register result status— Q_i indicates which functional unit will write each register, 0 means no write to this register

Fall 08

Add3		No					
Mult1		No					
0 Mult2		Yes	DIVD	M*F4	M(A1)		

Register result status:

Clock	F0	F2	F4	F6	F8	F10	F12	...	F30
56	FU	M*F4	M(A2)		(M-M+N	(M-M)	Mult2		

- Mult2 (DIVD) is completing; what is waiting for it?

Fall 08

CSE4201

Tomasulo Example Cycle 57

Instruction status:

Instruction	j	k	Exec			Write	Busy	Address
			Issue	Comp	Result			
LD	F6	34+	R2	1	3	4	Load1	No
LD	F2	45+	R3	2	4	5	Load2	No
MULTD	F0	F2	F4	3	15	16	Load3	No
SUBD	F8	F6	F2	4	7	8		
DIVD	F10	F0	F6	5	56	57		
ADDD	F6	F8	F2	6	10	11		

Reservation Stations:

Time	Name	Busy	Op	S1		S2		RS	RS
				Vj	Vk	Qj	Qk		
Add1		No							
Add2		No							
Add3		No							
Mult1		No							
Mult2	Yes		DIVD	M*F4	M(A1)				

Register result status:

Clock	F0	F2	F4	F6	F8	F10	F12	...	F30
56	FU	M*F4	M(A2)		(M-M+N	(M-M)	Result		

- Once again: In-order issue, out-of-order execution and out-of-order completion.

Tomasulo overlap iterations of loops

- Register renaming
 - Multiple iterations use different physical destinations for registers (dynamic loop unrolling).
- Reservation stations
 - Permit instruction issue to advance past integer control flow operations
 - Also buffer old values of registers - totally avoiding the WAR stall
- Other perspective: Tomasulo building data flow dependency graph on the fly

Tomasulo's 2 major advantages

1. Distribution of the hazard detection logic
 - **distributed reservation stations and the CDB**
 - **If multiple instructions waiting on single result, & each instruction has other operand, then instructions can be released simultaneously by broadcast on CDB**
 - **If a centralized register file were used, the units would have to read their results from the registers when register buses are available**
2. Elimination of stalls for WAW and WAR hazards
3. Load/store can be done out of program order if they do not address the same memory location (effective address).
