

# Parallel Algorithm --Minimum Spanning Tree

- Wrote by R. Setia, A.Nedunchezhan, S. Balachandaran, in HiPC 2009
- Presented by Xiwen Chen.

# Outline

- Brief introduction.
- Sequential algorithm.
- Concurrent Prim's algorithm.
- Some related problem.

# Introduction

- Minimum Spanning Tree(MST) is one of the well known classical graph problems.

# Applications

- Minimum Spanning Tree has many applications in VLSI layout and routing, wireless communication and various other fields.

# Sequential Algorithms

- The first serial algorithm for MST was given by a Czech scientist Borůvka, 1926.

Borůvka(1899-1995)

Prim(1921-now)

- Other two commonly used Greedy algorithms are Kruskal's algorithm (1956) and Prim's algorithm(1957).

Kruskal(1928-2010)

# Prim's Algorithm

- Initialize:  $V_{mst} = \{x\}$ ,  $x$  is an arbitrary node from  $V$ ,  $E_{mst} = \{\emptyset\}$ .
- Repeat until  $V_{mst} == V$ 
  - Choose an edge  $(u,v)$  with minimal weight such that  $u$  is in  $V_{mst}$  and  $v$  is not.
  - Add  $v$  to  $V_{mst}$  and  $(u,v)$  to the  $E_{mst}$ .

# Concurrent Prim's Algorithm

- Key ideas:
  - Each thread grows their single trees in parallel.
  - When collision occurs between two threads  $i$  and  $j$  ( $i < j$ ), thread  $j$  merges with  $i$ .  $i$  keeps growing and  $j$  chooses another node to grow a new tree.

# Concurrent Prim's Algorithm

- It remains the same for growing a single tree in an individual thread.
- For the merge part, we call the `MergeTree(i,j)` method to do that.

# Concurrent Prim's Algorithm

- Lemma 1.1 No cycles are formed during MergeTree operation.

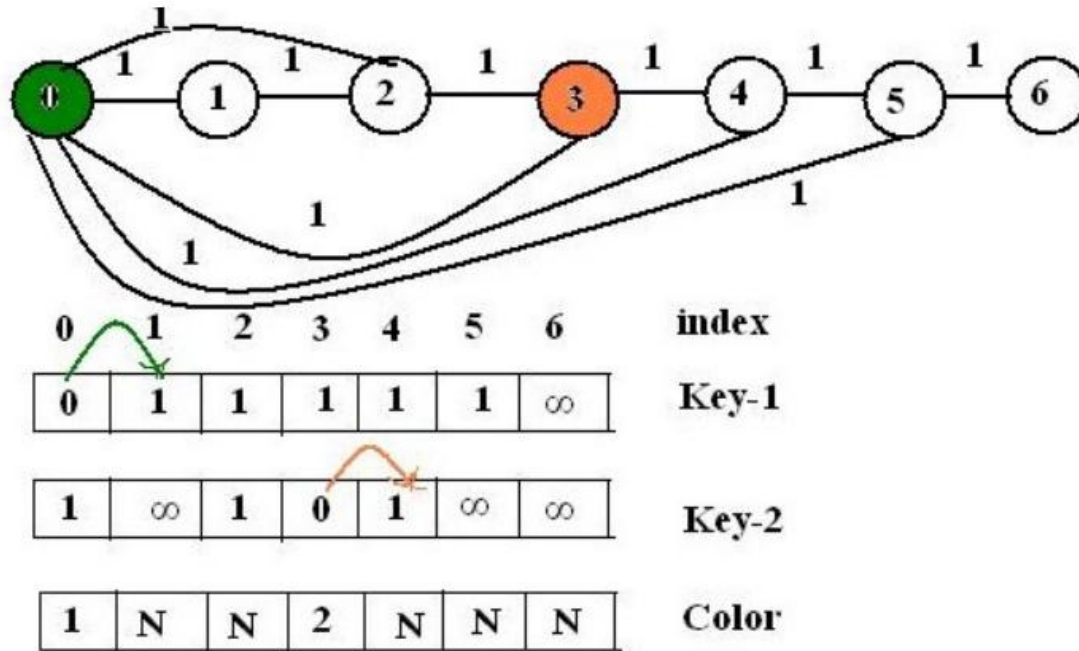

- Lemma 1.2 The edges added by the this this algorithm belong to MST.

# Load Balancing scheme

- Base Problem Size
  - A threshold value for the number of uncolored nodes. If # of nodes below that threshold, we terminate the thread  $j$  instead of let it pick a new random node to grow a new tree.
  - The writer has an empirically value equal to  $\frac{|V|}{p}$ , if there are  $p$  threads created.

# Heuristics

- Warp-around find-min

# Heuristics

- Threshold nodes
  - Kill the underperformed thread

# Experiments and results

Execution time vs number of processors for a given Graph and different base problem sizes
