

CSE 3214: Computer Network Protocols and Applications –Transport Layer

Dr. Peter Lian, Professor
Department of Computer Science and Engineering
York University
Email: peterlian@cse.yorku.ca
Office: 1012C Lassonde Building
Course website: http://wiki.cse.yorku.ca/course_archive/2012-13/W/3214

Chapter 3: Transport Layer

our goals:

- ❖ understand principles behind transport layer services:
 - multiplexing, demultiplexing
 - reliable data transfer
 - flow control
 - congestion control
- ❖ learn about Internet transport layer protocols:
 - UDP: connectionless transport
 - TCP: connection-oriented reliable transport
 - TCP congestion control

Transport Layer 3-2

Chapter 3 outline

- | | |
|--|--|
| 3.1 transport-layer services | 3.5 connection-oriented transport: TCP <ul style="list-style-type: none">▪ segment structure▪ reliable data transfer▪ flow control▪ connection management |
| 3.2 multiplexing and demultiplexing | |
| 3.3 connectionless transport: UDP | 3.6 principles of congestion control |
| 3.4 principles of reliable data transfer | 3.7 TCP congestion control |

Transport Layer 3-3

Transport services and protocols

- ❖ provide *logical communication* between app processes running on different hosts
- ❖ transport protocols run in end systems
 - send side: breaks app messages into *segments*, passes to network layer
 - receive side: reassembles segments into messages, passes to app layer
- ❖ more than one transport protocol available to apps
 - Internet: TCP and UDP

Transport Layer 3-4

Transport vs. network layer

- ❖ **network layer:** logical communication between hosts
- ❖ **transport layer:** logical communication between processes
 - relies on, enhances, network layer services

household analogy:

12 kids in Ann's house sending letters to 12 kids in Bill's house:

- ❖ hosts = houses
- ❖ processes = kids
- ❖ app messages = letters in envelopes
- ❖ transport protocol = Ann and Bill who demux to in-house siblings
- ❖ network-layer protocol = postal service

Transport Layer 3-5

Internet transport-layer protocols

- ❖ reliable, in-order delivery (TCP)
 - congestion control
 - flow control
 - connection setup
- ❖ unreliable, unordered delivery: UDP
 - no-frills extension of "best-effort" IP
- ❖ services not available:
 - delay guarantees
 - bandwidth guarantees

Transport Layer 3-6

Chapter 3 outline

- | | |
|--|---|
| 3.1 transport-layer services | 3.5 connection-oriented transport: TCP <ul style="list-style-type: none"> ▪ segment structure ▪ reliable data transfer ▪ flow control ▪ connection management |
| 3.2 multiplexing and demultiplexing | |
| 3.3 connectionless transport: UDP | 3.6 principles of congestion control |
| 3.4 principles of reliable data transfer | 3.7 TCP congestion control |

Transport Layer 3-7

Multiplexing/demultiplexing

multiplexing at sender:
handle data from multiple sockets, add transport header (later used for demultiplexing)

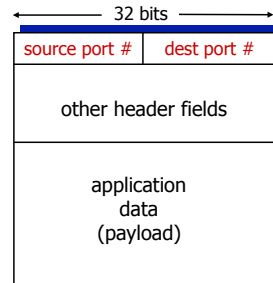

demultiplexing at receiver:
use header info to deliver received segments to correct socket

Transport Layer 3-8

How demultiplexing works

- ❖ host receives IP datagrams
 - each datagram has source IP address, destination IP address
 - each datagram carries one transport-layer segment
 - each segment has source, destination port number
- ❖ host uses **IP addresses & port numbers** to direct segment to appropriate socket

TCP/UDP segment format

Transport Layer 3-9

Connectionless demultiplexing

- ❖ recall in Socket Programming:

```
clientSocket=socket(AF_INET,
                    SOCK_DGRAM)
clientSocket.sendto(message,(serverName,
                             serverPort))
```

- ❖ When creating datagram to send into UDP socket, must specify

- destination IP address
- destination port #

- ❖ when host receives UDP segment:

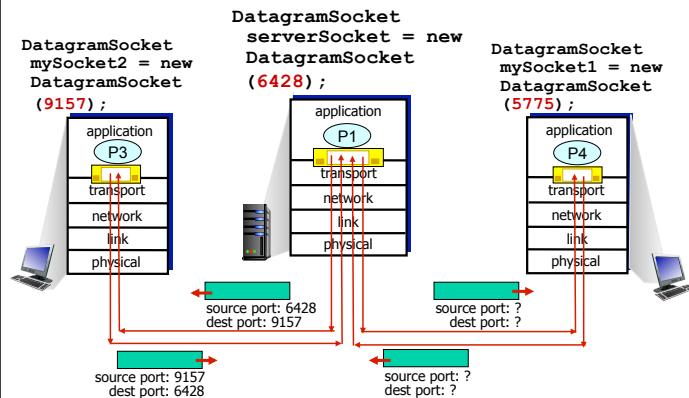

- checks destination port # in segment
- directs UDP segment to socket with that port #

IP datagrams with **same dest IP addr, & dest. port #**, but different source IP addresses and/or source port numbers will be directed to **same socket** at dest

Transport Layer 3-10

Connectionless demux: example

Transport Layer 3-11

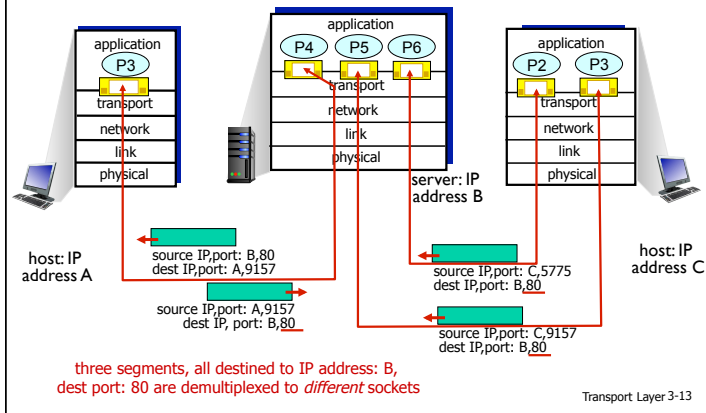

Connection-oriented demux

- ❖ TCP socket identified by 4-tuple:
 - source IP address
 - source port number
 - dest IP address
 - dest port number
- ❖ demux: receiver uses all four values to direct segment to appropriate socket

- ❖ server host may support many simultaneous TCP sockets:
 - each socket identified by its own 4-tuple
- ❖ web servers have different sockets for each connecting client
 - non-persistent HTTP will have different socket for each request

Transport Layer 3-12

Connection-oriented demux: example

Connection-oriented demux: example
