

Dijkstra's Algorithm

1 Initialization:

- 2 $N' = \{s\}$
- 3 for all nodes "n"
- 4 If "n" adjacent to "s"
- 5 then $D(n) = c(s,n)$
- 6 else $D(n) = \infty$

7

8 Loop

- 9 Find "m" not in N' such that $D(m)$ is a minimum
- 10 Add "m" to N'
- 11 update $D(n)$ for all "n" adjacent to "m" and not in N' :
- 12 $D(n) = \min(D(n), D(m) + c(m,n))$
- 13 If new cost to "n" is either old cost to "n" or known
- 14 shortest path cost to "m" plus cost from "m" to "n" *
- 15 until all nodes in N'

notation:

- ❖ $c(x,y)$: link cost from node x to y; cost = ∞ if not direct neighbors
- ❖ $D(n)$: current value of cost of path from source to "n"
- ❖ $P(n)$: predecessor node along path from source to n
- ❖ N' : set of nodes whose least cost path definitively known

Network Layer 4-90

Dijkstra's algorithm: example (Step 1)

Step	N'	$D(v),p(v)$	$D(w),p(w)$	$D(x),p(x)$	$D(y),p(y)$	$D(z),p(z)$
0	u	7,u	3,u	5,u	∞	∞
1	uw	6,w		5,u	11,w	∞

- 11 update $D(m)$ for all "n" adjacent to "m" and not in N' :
- 12 $D(n) = \min(D(n), D(m) + c(m,n))$

$N'(uw) \rightarrow$ update $D(v), D(x), D(y), D(z)$

$$D(v) = \min(D(v), D(w) + c(w,v))$$

$$= \min(7, 3+3) = 6$$

$$D(x) = \min(D(x), D(w) + c(w,x))$$

$$= \min(5, 3+4) = 5$$

$$D(y) = \min(D(y), D(w) + c(w,y))$$

$$= \min(\infty, 3+8) = 11$$

$$D(z) = \min(D(z), D(w) + c(w,z))$$

$$= \min(\infty, 3+\infty) = \infty$$

notation:

- ❖ $D(n)$: current value of cost of path from source to "n"
- ❖ N' : set of nodes whose least cost path definitively known

Network Layer 4-91

Dijkstra's algorithm: example (Step 2)

Step	N'	$D(v),p(v)$	$D(w),p(w)$	$D(x),p(x)$	$D(y),p(y)$	$D(z),p(z)$
0	u	7,u	3,u	5,u	∞	∞
1	uw	6,w		5,u	11,w	∞
2	uwvx	6,w			11,w	14,x

- 11 update $D(m)$ for all "n" adjacent to "m" and not in N' :
- 12 $D(n) = \min(D(n), D(m) + c(m,n))$

$N'(uwvx) \rightarrow$ update $D(v), D(y), D(z)$

$$D(v) = \min(D(v), D(x) + c(x,v))$$

$$= \min(6, 5+\infty) = 6$$

$$D(y) = \min(D(y), D(x) + c(x,y))$$

$$= \min(11, 5+7) = 11$$

$$D(z) = \min(D(z), D(x) + c(x,z))$$

$$= \min(\infty, 5+9) = 14$$

notation:

- ❖ $D(n)$: current value of cost of path from source to "n"
- ❖ N' : set of nodes whose least cost path definitively known

Network Layer 4-92

Dijkstra's algorithm: example (Step 3)

Step	N'	$D(v),p(v)$	$D(w),p(w)$	$D(x),p(x)$	$D(y),p(y)$	$D(z),p(z)$
0	u	7,u	3,u	5,u	∞	∞
1	uw	6,w		5,u	11,w	∞
2	uwvx	6,w			11,w	14,x
3	uwxvy				10,v	14,x

- 11 update $D(m)$ for all "n" adjacent to "m" and not in N' :
- 12 $D(n) = \min(D(n), D(m) + c(m,n))$

$N'(uwxvy) \rightarrow$ update $D(y), D(z)$

$$D(y) = \min(D(y), D(v) + c(v,y))$$

$$= \min(11, 6+4) = 10$$

$$D(z) = \min(D(z), D(v) + c(v,z))$$

$$= \min(14, 6+\infty) = 14$$

notation:

- ❖ $D(n)$: current value of cost of path from source to "n"
- ❖ N' : set of nodes whose least cost path definitively known

Network Layer 4-93

Dijkstra's algorithm: example (Step 4)

Step	N'	$D(v),p(v)$	$D(w),p(w)$	$D(x),p(x)$	$D(y),p(y)$	$D(z),p(z)$
0	u	7,u	3,u	5,u	∞	∞
1	uw	6,w		5,u	11,w	∞
2	uwvx	6,w			11,w	14,x
3	uwxvy				10,v	14,x
4	uwxvyz					12,y

- 11 update $D(m)$ for all "n" adjacent to "m" and not in N' :
- 12 $D(n) = \min(D(n), D(m) + c(m,n))$

$N'(uwxvyz) \rightarrow$ update $D(z)$

$$D(z) = \min(D(z), D(y) + c(y,z))$$

$$= \min(14, 10+2) = 12$$

notation:

- ❖ $D(n)$: current value of cost of path from source to "n"
- ❖ N' : set of nodes whose least cost path definitively known

Network Layer 4-94

Dijkstra's algorithm: example (Step 5)

Step	N'	$D(v),p(v)$	$D(w),p(w)$	$D(x),p(x)$	$D(y),p(y)$	$D(z),p(z)$
0	u	7,u	3,u	5,u	∞	∞
1	uw	6,w		5,u	11,w	∞
2	uwvx	6,w			11,w	14,x
3	uwxvy				10,v	14,x
4	uwxvyz					12,y
5	uwxvyz					

notes:

- ❖ construct shortest path tree by tracing predecessor nodes
- ❖ ties can exist (can be broken arbitrarily)

destination	link
x	(u,x)
w	(u,w)
v	(u,w)
y	(u,w)
z	(u,w)

Network Layer 4-95

Dijkstra's algorithm: another example

Step	N'	D(v),p(v)	D(w),p(w)	D(x),p(x)	D(y),p(y)	D(z),p(z)
0	u	2,u	5,u	1,u	∞	∞
1	ux	2,u	4,x		2,x	∞
2	uxy	2,u	3,y			4,y
3	uxyv		3,y			4,y
4	uxyvw					4,y
5	uxyvwz					

destination	link
v	(u,v)
x	(u,x)
y	(u,x)
w	(u,x)
z	(u,x)

Network Layer 4-96

Dijkstra's algorithm: example (2)

resulting shortest-path tree from u:

resulting forwarding table in u:

destination	link
v	(u,v)
x	(u,x)
y	(u,x)
w	(u,x)
z	(u,x)

Network Layer 4-97

Chapter 4: outline

- 4.1 introduction
- 4.2 virtual circuit and datagram networks
- 4.3 what's inside a router
- 4.4 IP: Internet Protocol
 - datagram format
 - IPv4 addressing
 - ICMP
 - IPv6
- 4.5 routing algorithms
 - link state
 - distance vector
 - hierarchical routing
- 4.6 routing in the Internet
 - RIP
 - OSPF
 - BGP
- 4.7 broadcast and multicast routing

Network Layer 4-98

Distance vector algorithm

Bellman-Ford equation (dynamic programming)

let

$d_x(y) :=$ least-cost path from x to y

then

$$d_x(y) = \min_v \{ c(x,v) + d_v(y) \}$$

\min taken over all neighbors v of x
 $c(x,v)$ cost to neighbor v
 $d_v(y)$ cost from neighbor v to destination y

Network Layer 4-99

Bellman-Ford example

clearly, $d_v(z) = 5$, $d_x(z) = 3$, $d_w(z) = 3$

B-F equation says:

$$\begin{aligned}
 d_u(z) &= \min \{ c(u,v) + d_v(z), \\
 &\quad c(u,x) + d_x(z), \\
 &\quad c(u,w) + d_w(z) \} \\
 &= \min \{ 2 + 5, \\
 &\quad 1 + 3, \\
 &\quad 5 + 3 \} = 4
 \end{aligned}$$

node achieving minimum is next hop in shortest path, used in forwarding table

Network Layer 4-100

Distance vector algorithm

❖ $D_x(y)$ = estimate of least cost from x to y

- x maintains distance vector $D_x = [D_x(y): y \in N]$

❖ node x:

- knows cost to each neighbor v: $c(x,v)$
- maintains its neighbors' distance vectors. For each neighbor v, x maintains $D_v = [D_v(y): y \in N]$

Network Layer 4-101

Distance vector algorithm

key idea:

- from time-to-time, each node sends its own distance vector estimate to neighbors
- when x receives new DV estimate from neighbor, it updates its own DV using B-F equation:

$$D_x(y) \leftarrow \min_v \{c(x,v) + D_v(y)\} \text{ for each node } y \in N$$

- under minor, natural conditions, the estimate $D_x(y)$ converge to the actual least cost $d_x(y)$

Network Layer 4-102

Distance vector algorithm

iterative, asynchronous:

- each local iteration caused by:
 - local link cost change
 - DV update message from neighbor

distributed:

- each node notifies neighbors *only* when its DV changes
 - neighbors then notify their neighbors if necessary

each node:

Network Layer 4-103

Network Layer 4-104

Network Layer 4-105

Distance vector: link cost changes (1)

link cost changes:

- node detects local link cost change
- updates routing info, recalculates distance vector
- if DV changes, notify neighbors

Network Layer 4-106

Distance vector: link cost changes (2)

link cost changes:

- node detects local link cost change
- bad news travels slow - “count to infinity” problem!
- 44 iterations before algorithm stabilizes

Network Layer 4-107

Distance vector: count to infinity

Network Layer 4-108

Distance vector: Poison Reverse

If Z routes through Y to get to X :

- Z tells Y its (Z's) distance to X is infinite (so Y won't route to X via Z)
- Still, can have problems when more than 2 routers are involved

Network Layer 4-109

Comparison of LS and DV algorithms

	Link State	Distance Vector
size of (update) routing info	small, contains only neighbours' link costs	potentially long distance vectors
communication overhead	flood to all nodes – overhead $O(N^2E)$, where $N = \#$ of nodes, $E = \#$ of edges	send distance vectors only to neighbours – $O(N^2K)$ if each of N routers has K neighbours
convergence speed	do NOT need to recalculate LSP's before forwarding \Rightarrow faster	takes a while to propagate changes to rest of network
space requirements	maintains entire topology in a link database – $O(N^2K)$ if each of N routers has K neighbours	maintains only neighbours' states – $O(K)$ distance vectors
computational complexity per one destination	$O(N^2(N-1)/2) = O(N^3)$	$O(N^2K \cdot \text{Diameter})$
computational robustness	each router computes paths on its own – no error propagation	routers compute paths collectively – errors propagate
security / fault tolerance	false/corrupt LSPs can be flooded to all routers	false/corrupt LSPs can be flooded to all routers

Network Layer 4-110

Chapter 4: outline

4.1 introduction

4.2 virtual circuit and datagram networks

4.3 what's inside a router

4.4 IP: Internet Protocol

- datagram format
- IPv4 addressing
- ICMP
- IPv6

4.5 routing algorithms

- link state
- distance vector
- hierarchical routing

4.6 routing in the Internet

- RIP
- OSPF
- BGP

4.7 broadcast and multicast routing

Network Layer 4-111

Hierarchical routing

our routing study thus far - idealization

- ❖ all routers identical
- ❖ network "flat"

... not true in practice

scale: with 600 million destinations:

- ❖ can't store all dest's in routing tables!
- ❖ routing table exchange would swamp links!

administrative autonomy

- ❖ internet = network of networks
- ❖ each network admin may want to control routing in its own network

Network Layer 4-112

Hierarchical routing

- ❖ aggregate routers into regions, "autonomous systems" (AS)

- ❖ routers in same AS run same routing protocol

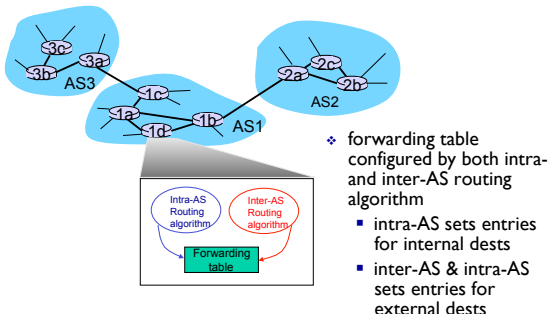

- "intra-AS" routing protocol
- routers in different AS can run different intra-AS routing protocol

gateway router:

- ❖ at "edge" of its own AS
- ❖ has link to router in another AS

Network Layer 4-113

Interconnected ASes

Network Layer 4-114

Inter-AS tasks

- ❖ suppose router in AS1 receives datagram destined outside of AS1:
 - router should forward packet to gateway router, but which one?

AS1 must:

- learn which dests are reachable through AS2, which through AS3
- propagate this reachability info to all routers in AS1

job of inter-AS routing!

Network Layer 4-115

Example: setting forwarding table in router 1d

- ❖ suppose AS1 learns (via inter-AS protocol) that subnet **x** is reachable via AS3 (gateway 1c), but not via AS2
 - inter-AS protocol propagates reachability info to all internal routers
- ❖ router 1d determines from intra-AS routing info that its interface **1** is on the least cost path to 1c
 - installs forwarding table entry **(x,1)**

Network Layer 4-116

Example: choosing among multiple ASes

- ❖ now suppose AS1 learns from inter-AS protocol that subnet **x** is reachable from AS3 *and* from AS2.
- ❖ to configure forwarding table, router 1d must determine which gateway it should forward packets towards for dest **x**
 - this is also job of inter-AS routing protocol!

Network Layer 4-117

Example: choosing among multiple ASes

- ❖ now suppose AS1 learns from inter-AS protocol that subnet **x** is reachable from AS3 *and* from AS2.
- ❖ to configure forwarding table, router 1d must determine towards which gateway it should forward packets for dest **x**
 - this is also job of inter-AS routing protocol!
- ❖ **hot potato routing**: send packet towards closest of two routers.

Network Layer 4-118

Chapter 4: outline

- 4.1 introduction
- 4.2 virtual circuit and datagram networks
- 4.3 what's inside a router
- 4.4 IP: Internet Protocol
 - datagram format
 - IPv4 addressing
 - ICMP
 - IPv6
- 4.5 routing algorithms
 - link state
 - distance vector
 - hierarchical routing
- 4.6 routing in the Internet
 - RIP
 - OSPF
 - BGP
- 4.7 broadcast and multicast routing

Network Layer 4-119

Intra-AS Routing

- ❖ also known as *interior gateway protocols (IGP)*
- ❖ most common intra-AS routing protocols:
 - RIP: Routing Information Protocol
 - OSPF: Open Shortest Path First
 - IGRP: Interior Gateway Routing Protocol (Cisco proprietary)

Network Layer 4-120

RIP (Routing Information Protocol)

- ❖ distance vector algorithm
 - distance metric: # hops (max = 15 hops), each link has cost 1
 - DVs exchanged with neighbors every 30 sec in response message (aka *advertisement*)
 - each advertisement: list of up to 25 destination *subnets* (in IP addressing sense)

from router A to destination *subnets*:

subnet	hops
u	1
v	2
w	2
x	3
y	3
z	2

Network Layer 4-121

RIP: example

routing table in router D

destination subnet	next router	# hops to dest
w	A	2
y	B	2
z	B	7
x	--	1
....

Network Layer 4-122

RIP: example

routing table in router D

destination subnet	next router	# hops to dest
w	A	2
y	B	2
z	B	7
x	--	1
....

Network Layer 4-123

RIP: link failure, recovery

if no advertisement heard after 180 sec --> neighbor/
link declared dead

- routes via neighbor invalidated
- new advertisements sent to neighbors
- neighbors in turn send out new advertisements (if tables changed)
- link failure info quickly (?) propagates to entire net
- *poison reverse* used to prevent ping-pong loops (infinite distance = 16 hops)

Network Layer 4-124

RIP table processing

- ❖ RIP routing tables managed by *application-level* process called route-d (daemon)
- ❖ advertisements sent in UDP packets, periodically repeated

Network Layer 4-125

OSPF (Open Shortest Path First)

- ❖ “open”: publicly available
- ❖ uses link state algorithm
 - LS packet dissemination
 - topology map at each node
 - route computation using Dijkstra’s algorithm
- ❖ OSPF advertisement carries one entry per neighbor
- ❖ advertisements flooded to **entire AS**
 - carried in OSPF messages directly over IP (rather than TCP or UDP)
- ❖ **IS-IS routing** protocol: nearly identical to OSPF

Network Layer 4-126

OSPF “advanced” features (not in RIP)

- ❖ **security**: all OSPF messages authenticated (to prevent malicious intrusion)
- ❖ **multiple** same-cost **paths** allowed (only one path in RIP)
- ❖ for each link, multiple cost metrics for different **TOS** (e.g., satellite link cost set “low” for best effort ToS; high for real time ToS)
- ❖ integrated uni- and **multicast** support:
 - Multicast OSPF (MOSPF) uses same topology data base as OSPF
- ❖ **hierarchical** OSPF in large domains.

Network Layer 4-127

Hierarchical OSPF

Network Layer 4-128

Hierarchical OSPF

- ❖ **two-level hierarchy**: local area, backbone.
 - link-state advertisements only in area
 - each nodes has detailed area topology; only know direction (shortest path) to nets in other areas.
- ❖ **area border routers**: “summarize” distances to nets in own area, advertise to other Area Border routers.
- ❖ **backbone routers**: run OSPF routing limited to backbone.
- ❖ **boundary routers**: connect to other AS’s.

Network Layer 4-129

Internet inter-AS routing: BGP

- ❖ **BGP (Border Gateway Protocol)**: the de facto inter-domain routing protocol
 - “glue that holds the Internet together”
- ❖ BGP provides each AS a means to:
 - **eBGP**: obtain subnet reachability information from neighboring ASs.
 - **iBGP**: propagate reachability information to all AS-internal routers.
 - determine “good” routes to other networks based on reachability information and policy.
- ❖ allows subnet to advertise its existence to rest of Internet: “*I am here*”

Network Layer 4-130

BGP basics

- ❖ **BGP session**: two BGP routers (“peers”) exchange BGP messages:
 - advertising **paths** to different destination network prefixes (“path vector” protocol)
 - exchanged over semi-permanent TCP connections
- ❖ when AS3 advertises a prefix to AS1:
 - AS3 **promises** it will forward datagrams towards that prefix
 - AS3 can aggregate prefixes in its advertisement

Network Layer 4-131

BGP basics: distributing path information

- ❖ using eBGP session between 3a and 1c, AS3 sends prefix reachability info to AS1.
 - 1c can then use iBGP to distribute new prefix info to all routers in AS1
 - 1b can then re-advertise new reachability info to AS2 over 1b-to-2a eBGP session
- ❖ when router learns of new prefix, it creates entry for prefix in its forwarding table.

Path attributes and BGP routes

- ❖ advertised prefix includes BGP attributes
 - prefix + attributes = "route"
- ❖ two important attributes:
 - **AS-PATH**: contains ASs through which prefix advertisement has passed: e.g., AS 67, AS 17
 - **NEXT-HOP**: indicates specific internal-AS router to next-hop AS. (may be multiple links from current AS to next-hop-AS)
- ❖ gateway router receiving route advertisement uses **import policy** to accept/decline
 - e.g., never route through AS x
 - **policy-based** routing

Network Layer 4-133

BGP route selection

- ❖ router may learn about more than 1 route to destination AS, selects route based on:
 1. local preference value attribute: policy decision
 2. shortest AS-PATH
 3. closest NEXT-HOP router: hot potato routing
 4. additional criteria

Network Layer 4-134

BGP messages

- ❖ BGP messages exchanged between peers over TCP connection
- ❖ BGP messages:
 - **OPEN**: opens TCP connection to peer and authenticates sender
 - **UPDATE**: advertises new path (or withdraws old)
 - **KEEPALIVE**: keeps connection alive in absence of UPDATES; also ACKs OPEN request
 - **NOTIFICATION**: reports errors in previous msg; also used to close connection

Network Layer 4-135

BGP routing policy

- ❖ A,B,C are **provider networks**
- ❖ X,W,Y are customer (of provider networks)
- ❖ X is **dual-homed**: attached to two networks
 - X does not want to route from B via X to C
 - .. so X will not advertise to B a route to C

Network Layer 4-136

BGP routing policy (2)

- ❖ A advertises path AW to B
- ❖ B advertises path BAW to X
- ❖ Should B advertise path BAW to C?
 - No way! B gets no "revenue" for routing CBAW since neither W nor C are B's customers
 - B wants to force C to route to w via A
 - B wants to route **only** to/from its customers!

Network Layer 4-137

Why different Intra-, Inter-AS routing ?

policy:

- ❖ inter-AS: admin wants control over how its traffic routed, who routes through its net.
- ❖ intra-AS: single admin, so no policy decisions needed

scale:

- ❖ hierarchical routing saves table size, reduced update traffic

performance:

- ❖ intra-AS: can focus on performance
- ❖ inter-AS: policy may dominate over performance

Network Layer 4-138

Chapter 4: outline

- 4.1 introduction
- 4.2 virtual circuit and datagram networks
- 4.3 what's inside a router
- 4.4 IP: Internet Protocol
 - datagram format
 - IPv4 addressing
 - ICMP
 - IPv6
- 4.5 routing algorithms
 - link state
 - distance vector
 - hierarchical routing
- 4.6 routing in the Internet
 - RIP
 - OSPF
 - BGP
- 4.7 broadcast and multicast routing

Network Layer 4-139

Broadcast and multicast routing

- ❖ One to many communications
- ❖ Broadcast – delivering a packet sent from a source node to all other nodes in the network
- ❖ Multicast – a single source node to send a copy of a packet to a subset of the other network nodes.

Network Layer 4-140

Broadcast

- ❖ deliver packets from source to all other nodes
- ❖ source duplication is inefficient:

- ❖ source duplication: how does source determine recipient addresses?

Network Layer 4-141

In-network duplication

- ❖ **flooding**: when node receives broadcast packet, sends copy to all neighbors
 - problems: cycles & broadcast storm
- ❖ **controlled flooding**: node only broadcasts pkt if it hasn't broadcast same packet before
 - node keeps track of packet ids already broadcasted
 - or reverse path forwarding (RPF): only forward packet if it arrived on shortest path between node and source
- ❖ **spanning tree**:
 - no redundant packets received by any node

Network Layer 4-142

Spanning tree

- ❖ first construct a spanning tree
- ❖ nodes then forward/make copies only along spanning tree

Network Layer 4-143

Spanning tree: creation

- ❖ center node
- ❖ each node sends unicast join message to center node
 - message forwarded until it arrives at a node already belonging to spanning tree

(a) stepwise construction of spanning tree (center: E)

(b) constructed spanning tree

Network Layer 4-144

Multicast

- ❖ **goal:** sending a packet to a group of members
- ❖ Benefits of multicast
 - better bandwidth utilization
 - less host/router processing
 - quicker participation
- ❖ Applications
 - Video/Audio broadcast (One sender)
 - Video conferencing (Many senders)
 - Real time news distribution
 - Interactive gaming

Network Layer 4-145

Internet multicast

- ❖ Senders transmit IP datagrams to a "host group"
- ❖ "Host group" identified by a **class D IP address**
- ❖ Members of host group could be present anywhere in the Internet
- ❖ Members **join** and **leave** the group and indicate this to the routers
- ❖ Routers listen to all multicast addresses and use multicast routing protocols to manage groups
- ❖ Routing protocols:
 - DVMRP: distance vector multicast routing protocol, RFC1075
 - PIM: protocol independent multicast

Network Layer 4-146

Chapter 4: done!

- 4.1 introduction
 - 4.2 virtual circuit and datagram networks
 - 4.3 what's inside a router
 - 4.4 IP: Internet Protocol
 - datagram format, IPv4 addressing, ICMP, IPv6
 - 4.5 routing algorithms
 - link state, distance vector, hierarchical routing
 - 4.6 routing in the Internet
 - RIP, OSPF, BGP
 - 4.7 broadcast and multicast routing
- ❖ understand principles behind network layer services:
 - network layer service models, forwarding versus routing
 - how a router works, routing (path selection), broadcast, multicast
 - ❖ instantiation, implementation in the Internet

Network Layer 4-147

A note on these slides

Part of PPT slides were adopted from Prof. Natalija Vlatkovic's early CSE3214 course and the rest were adopted from the book "Computer Networking: A Top-Down Approach" 6th Edition by Jim Kurose and Keith Ross
