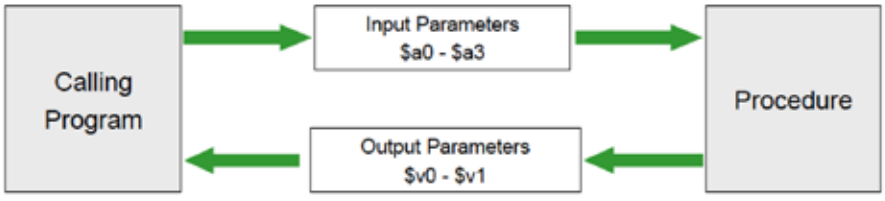
CSE2021 Computer Organization

Chapter 2: Part 2

Supporting Procedures

Procedure Calling

- Procedure (function) performs a specific task and return results to caller.



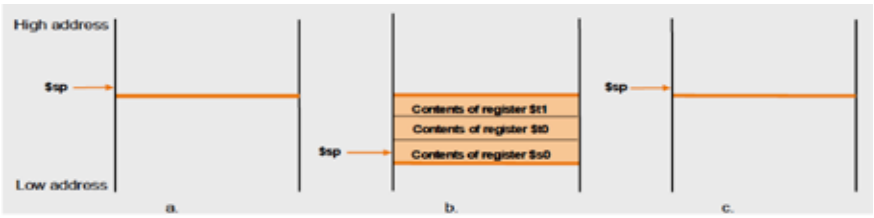
Procedure Calling

- Calling program
  - place parameters in registers $a0 - $a3
  - Transfer control to procedure
- Called procedure
  - Acquire storage for procedure, save values of required register in a stack $sp
  - Perform procedure's operations, restore the values of registers that it used
  - Place result in register for caller $v0 - $v1
  - Return to place of call by returning to instruction whose address is saved in $ra

Register Usage

- $a0 – $a3: arguments (reg's 4 – 7)
- $v0, $v1: result values (reg's 2 and 3)
- $t0 – $t9: temporaries
  - Can be overwritten by callee
- $s0 – $s7: saved
  - Must be saved/restored by callee
- $gp: global pointer for static data (reg 28)
- $sp: stack pointer (reg 29)
- $fp: frame pointer (reg 30)
- $ra: return address (reg 31)

Stack



- First-in-last-out queue
- Placing date onto the stack: push
- Removing data from the stack: pop
- Stack “grow” from higher addresses to lower addresses
  - Push values onto the stack by subtracting from the stack pointer
  - Pop values from the stack by adding to the stack pointer

Procedure Call Instructions

- Procedure call: jump and link

  ```
  jal ProcedureLabel
  ```

  - Jumps to target address
  - Address of following instruction put in $ra
  - $ra is called the return address
- Procedure return: jump register

  ```
  jr $ra
  ```

  - Copies $ra to program counter
  - Can also be used for computed jumps
    - e.g., for case/switch statements

Leaf Procedure Example

- Procedures that do not call others are called leaf procedure.
- C code:

```
int leaf_example (int g, h, i, j)
{ int f;
  f = (g + h) - (i + j);
  return f;
}
```

  - Arguments g, h, i, j in $a0, $a1, $a2, $a3
  - f in $s0 (hence, need to save $s0 on stack)
  - Result in $v0

Leaf Procedure Example

- MIPS code for procedure:

`leaf_example:`	
`addi $sp, $sp, -4` `sw $s0, 0($sp)`	Save $s0 on stack

`add $t0, $a0, $a1`
`add $t1, $a2, $a3`
`sub $s0, $t0, $t1`
	Procedure body

`add $v0, $s0, $zero`	Result
`lw $s0, 0($sp)` `addi $sp, $sp, 4`	Restore $s0
`jr $ra`	Return

Leaf Procedure Example

- MIPS code for calling function:

```
main:

…
jal leaf_example
…
```

Non-Leaf Procedures

- Procedures that call other procedures
- For nested call, caller needs to save on the stack:
  - Its return address
  - Any arguments and temporaries needed after the call
- Restore from the stack after the call

Non-Leaf Procedure Example

- C code:

```
int fact (int n)
{
  if (n < 1) return f;
  else return n * fact(n - 1);
}
```

  - Argument n in $a0
  - Result in $v0

Non-Leaf Procedure Example

- MIPS code:

```
fact:
    addi $sp, $sp, -8      # adjust stack for 2 items
    sw   $ra, 4($sp)       # save return address
    sw   $a0, 0($sp)       # save argument
    slti $t0, $a0, 1       # $t0=1 if $a0 < 1 (n<1)
    beq  $t0, $zero, L1    # jump to L1 if $t0=0(n>=1)
    addi $v0, $zero, 1     # if so, result is 1
    addi $sp, $sp, 8       # pop 2 items from stack*
    jr   $ra               # and return
L1: addi $a0, $a0, -1      # else decrement n
    jal  fact              # recursive call
    lw   $a0, 0($sp)       # restore original n
    lw   $ra, 4($sp)       # and return address
    addi $sp, $sp, 8       # pop 2 items from stack
    mul  $v0, $a0, $v0     # multiply to get result
    jr   $ra               # and return
```

Note: $a0 & $ra do not change if n<1, so $a0 & $ra are not loaded before pop them

Register Summary

- The following registers are preserved on call
  - $s0-$s7, $gp, $sp, $fp, and $ra

Register Number	Mnemonic Name	Conventional Use	Register Number	Mnemonic Name	Conventional Use
$0	zero	Permanently 0	$24, $25	$t8, $t9	Temporary
$1	$at	Assembler Temporary (reserved)	$26, $27	$k0, $k1	Kernel (reserved for OS)
$2, $3	$v0, $v1	Value returned by a subroutine	$28	$gp	Global Pointer
$4–$7	$a0–$a3	Arguments to a subroutine	$29	$sp	Stack Pointer
$8–$15	$t0–$t7	Temporary (not preserved across a function call)	$30	$fp	Frame Pointer
$16–$23	$s0–$s7	Saved registers (preserved across a function call)	$31	$ra	Return Address

CSE2021 Computer Organization

Communicating with People

Character Data

- Byte-encoded character sets
  - ASCII: 128 characters
    - 95 graphic, 33 control
  - Latin-1: 256 characters
    - ASCII, +96 more graphic characters
- Unicode: 32-bit character set
  - Used in Java, C++ wide characters, …
  - Most of the world's alphabets, plus symbols
  - UTF-8, UTF-16: variable-length encodings

ASCII Representation of Characters

Dec	Hex	Name	Char	Ctrl-char	Dec	Hex	Char	Dec	Hex	Char	Dec	Hex	Char

ASCII Characters

- American Standard Code for Information Interchange (ASCII).
- Most computers use 8-bit to represent each character. (Java uses Unicode, which is 16-bit).
- Strings are combination of characters.
- How to load a byte?
  - lb, lbu, sb for byte (ASCII)
  - lh, lhu, sh for half-word instruction (Unicode)

Byte/Halfword Operations

- Could use bitwise operations
- MIPS byte/halfword load/store
  - String processing is a common case

```
lb rt, offset(rs)      lh rt, offset(rs)
```

  - Sign extend to 32 bits in rt

```
lbu rt, offset(rs)     lhu rt, offset(rs)
```

  - Zero extend to 32 bits in rt

```
sb rt, offset(rs)      sh rt, offset(rs)
```

  - Store just rightmost byte/halfword

String Copy Example

- C code:
  - Null-terminated string

```
void strcpy (char x[], char y[])
{ int i;
  i = 0;
  while ((x[i]=y[i])!='\0')
    i += 1;
}
```

  - Addresses of x, y in $a0, $a1
  - i in $s0

String Copy Example

- MIPS code:

```
strcpy:
    addi $sp, $sp, -4       # adjust stack for 1 item
    sw   $s0, 0($sp)        # save $s0
    add  $s0, $zero, $zero  # i = 0
L1: add  $t1, $s0, $a1      # addr of y[i] in $t1
    lbu  $t2, 0($t1)        # $t2 = y[i]
    add  $t3, $s0, $a0      # addr of x[i] in $t3
    sb   $t2, 0($t3)        # x[i] = y[i]
    beq  $t2, $zero, L2     # exit loop if y[i] == 0
    addi $s0, $s0, 1        # i = i + 1
    j    L1                 # next iteration of loop
L2: lw   $s0, 0($sp)        # restore saved $s0
    addi $sp, $sp, 4        # pop 1 item from stack
    jr   $ra                # and return
```

32-bit Constants

- Most constants are small
  - 16-bit immediate is sufficient
- For the occasional 32-bit constant
  - Use lui (load upper immediate)

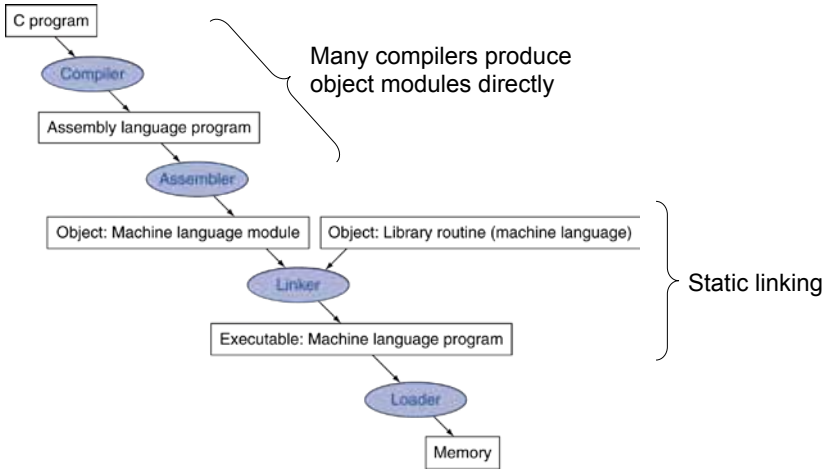
    `lui rt, constant`
  - Copies 16-bit constant to left 16 bits of rt
  - Clears right 16 bits of rt to 0

`lhi $s0, 61`	0000 0000 0111 1101	0000 0000 0000 0000
`ori $s0, $s0, 2304`	0000 0000 0111 1101	0000 1001 0000 0000

CSE2021 Computer Organization

Translating and Starting a Program

Translation Hierarchy for C



Translation

- Assembler (or compiler) translates program into machine instructions
- Linker produces an executable image
- Loader load from image file on disk into memory

CSE2021 Computer Organization

SPIM Simulator

SPIM Simulator

- SPIM is a software simulator that runs assembly language programs
- SPIM is just MIPS spelled backwards
- SPIM can read and immediately execute assembly language files
- Two versions for different machines
  - Unix: xspim(used in lab), spim
  - PC/Mac: QtSpim
- Resources and Download
  - http://spimsimulator.sourceforge.net

System Calls in SPIM

- SPIM provides a small set of system-like services through the system call (syscall) instruction.
- Format for system calls
  - Place value of input argument in $a0
  - Place value of system-call-code in $v0
  - syscall

System Calls

Example: print a string

```
.data
   str:
   .asciiz “answer is:”
.text
   addi $v0,$zero,4
   la $a0, str
   #pseudoinstruction
   syscall
```

Service	System Call Code	Arguments	Result
print_int	1	$a0 = integer	
print_float	2	$f12 = float	
print_double	3	$f12 = double	
print_string	4	$a0 = string	
read_int	5		integer (in $v0)
read_float	6		float (in $f0)
read_double	7		double (in $f0)
read_string	8	$a0 = buffer, $a1 = length	
sbrk	9	$a0 = amount	address (in $v0)
exit	10		
print_character	11	$a0 = character	
read_character	12		character (in $v0)
open	13	$a0 = filename,	file descriptor (in $v0)
		$a1 = flags, $a2 = mode	
read	14	$a0 = file descriptor,	bytes read (in $v0)
		$a1 = buffer, $a2 = count	
write	15	$a0 = file descriptor,	bytes written (in $v0)
		$a1 = buffer, $a2 = count	
close	16	$a0 = file descriptor	0 (in $v0)
exit2	17	$a0 = value	

Reading

- Read Appendix B.9 for SPIM
- List of Pseudoinstruction can be found on page 281

CSE2021 Computer Organization

Other Instruction Sets

ARM & MIPS Similarities

- ARM: the most popular embedded core
- Similar basic set of instructions to MIPS

	ARM	MIPS
Date announced	1985	1985
Instruction size	32 bits	32 bits
Address space	32-bit flat	32-bit flat
Data alignment	Aligned	Aligned
Data addressing modes	9	3
Integer Registers	15 × 32-bit	31 × 32-bit
Input/output	Memory mapped	Memory mapped

The Intel x86 ISA

- Evolution with backward compatibility
  - 8080 (1974): 8-bit microprocessor
    - Accumulator, plus 3 index-register pairs
  - 8086 (1978): 16-bit extension to 8080
    - Complex instruction set (CISC)
  - 8087 (1980): floating-point coprocessor
    - Adds FP instructions and register stack
  - 80286 (1982): 24-bit addresses, MMU
    - Segmented memory mapping and protection
  - 80386 (1985): 32-bit extension (now IA-32)
    - Additional addressing modes and operations
    - Paged memory mapping as well as segments

The Intel x86 ISA

- Further evolution…
  - i486 (1989): pipelined, on-chip caches and FPU
    - Compatible competitors: AMD, Cyrix, …
  - Pentium (1993): superscalar, 64-bit datapath
    - Later versions added MMX (Multi-Media eXtension) instructions
    - The infamous FDIV bug
  - Pentium Pro (1995), Pentium II (1997)
    - New microarchitecture (see Colwell, *The Pentium Chronicles*)
  - Pentium III (1999)
    - Added SSE (Streaming SIMD Extensions) and associated registers
  - Pentium 4 (2001)
    - New microarchitecture
    - Added SSE2 instructions

The Intel x86 ISA

- And further…
  - AMD64 (2003): extended architecture to 64 bits
  - EM64T – Extended Memory 64 Technology (2004)
    - AMD64 adopted by Intel (with refinements)
    - Added SSE3 instructions
  - Intel Core (2006)
    - Added SSE4 instructions, virtual machine support
  - AMD64 (announced 2007): SSE5 instructions
    - Intel declined to follow, instead…
  - Advanced Vector Extension (announced 2008)
    - Longer SSE registers, more instructions
- If Intel didn't extend with compatibility, its competitors would!
  - Technical elegance ≠ market success

Concluding Remarks

- Design principles
  1. Simplicity favors regularity
  2. Smaller is faster
  3. Make the common case fast
  4. Good design demands good compromises
- Layers of software/hardware
  - Compiler, assembler, hardware
- MIPS: typical of RISC ISAs
  - c.f. x86

Concluding Remarks

- Measure MIPS instruction executions in benchmark programs
  - Consider making the common case fast
  - Consider compromises

Instruction class	MIPS examples	SPEC2006 Int	SPEC2006 FP
Arithmetic	`add, sub, addi`	16%	48%
Data transfer	`lw, sw, lb, lbu, lh, lhu, sb, lui`	35%	36%
Logical	`and, or, nor, andi, ori, sll, srl`	12%	4%
Cond. Branch	`beq, bne, slt, slti, sltiu`	34%	8%
Jump	`j, jr, jal`	2%	0%
