

## Memory Operand Example 1

- C code:
  - g = h + A[8];
    - g in \$s1, h in \$s2, base address of A in \$s3
- Compiled MIPS code:
  - Index 8 requires offset of 32
    - 4 bytes per word

```
lw  $t0, 32($s3)    # load word
add $s1, $s2, $t0
```

offset

base register

Chapter 2 — Instructions: Language of the Computer — 18

## Memory Operand Example 2

- C code:
  - A[12] = h + A[8];
    - h in \$s2, base address of A in \$s3

- Compiled MIPS code:

- Index 8 requires offset of 32

```
lw  $t0, 32($s3)    # load word
add $t0, $s2, $t0
sw  $t0, 48($s3)    # store word
```

Chapter 2 — Instructions: Language of the Computer — 19

## Registers vs. Memory

- Registers are faster to access than memory
- Operating on memory data requires loads and stores
  - More instructions to be executed
- Compiler must use registers for variables as much as possible
  - Only spill to memory for less frequently used variables
  - Register optimization is important!

Chapter 2 — Instructions: Language of the Computer — 20

## Immediate Operands

- Constant data specified in an instruction  
`addi $s3, $s3, 4`
- No subtract immediate instruction
  - Just use a negative constant  
`addi $s2, $s1, -1`
- **Design Principle 3: Make the common case fast**
  - Small constants are common
  - Immediate operand avoids a load instruction

Chapter 2 — Instructions: Language of the Computer — 21

## The Constant Zero

- MIPS register 0 (\$zero) is the constant 0
  - Cannot be overwritten
- Useful for common operations
  - E.g., move between registers  
add \$t2, \$s1, \$zero

Chapter 2 — Instructions: Language of the Computer — 22

## Unsigned Binary Integers

- Given an n-bit number

$$x = x_{n-1}2^{n-1} + x_{n-2}2^{n-2} + \dots + x_12^1 + x_02^0$$

- Range: 0 to  $+2^n - 1$

- Example

$$\begin{aligned} & 0000\ 0000\ 0000\ 0000\ 0000\ 0000\ 0000\ 1011_2 \\ &= 0 + \dots + 1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 1 \times 2^0 \\ &= 0 + \dots + 8 + 0 + 2 + 1 = 11_{10} \end{aligned}$$

- Using 32 bits

- 0 to +4,294,967,295

§2.4 Signed and Unsigned Numbers

Chapter 2 — Instructions: Language of the Computer — 23

## 2s-Complement Signed Integers

- Given an n-bit number

$$x = -x_{n-1}2^{n-1} + x_{n-2}2^{n-2} + \dots + x_12^1 + x_02^0$$

- Range:  $-2^{n-1}$  to  $+2^{n-1} - 1$

- Example

$$\begin{aligned} & 1111\ 1111\ 1111\ 1111\ 1111\ 1111\ 1111\ 1100_2 \\ &= -1 \times 2^{31} + 1 \times 2^{30} + \dots + 1 \times 2^2 + 0 \times 2^1 + 0 \times 2^0 \\ &= -2,147,483,648 + 2,147,483,644 = -4_{10} \end{aligned}$$

- Using 32 bits

$$-2,147,483,648 \text{ to } +2,147,483,647$$

Chapter 2 — Instructions: Language of the Computer — 24

## 2s-Complement Signed Integers

- Bit 31 is sign bit
  - 1 for negative numbers
  - 0 for non-negative numbers
- $-(-2^{n-1})$  can't be represented
- Non-negative numbers have the same unsigned and 2s-complement representation
- Some specific numbers
  - 0: 0000 0000 ... 0000
  - 1: 1111 1111 ... 1111
  - Most-negative: 1000 0000 ... 0000
  - Most-positive: 0111 1111 ... 1111

Chapter 2 — Instructions: Language of the Computer — 25

## Signed Negation

- Complement and add 1
  - Complement means  $1 \rightarrow 0, 0 \rightarrow 1$

$$x + \bar{x} = 1111 \dots 111_2 = -1$$

$$\bar{x} + 1 = -x$$

- Example: negate +2
  - $+2 = 0000 \ 0000 \dots 0010_2$
  - $-2 = 1111 \ 1111 \dots 1101_2 + 1$   
 $= 1111 \ 1111 \dots 1110_2$

Chapter 2 — Instructions: Language of the Computer — 26

## 2's Complement

$$-2^3 =$$

$$-(2^3 - 1) =$$

complement all the bits

0101

and add a 1

0110 (6)

$$2^3 - 1 =$$

2'sc binary	decimal
1000	-8
1001	-7
1010	-6
1011	-5
1100	-4
1101	-3
1110	-2
1111	-1
0000	0
0001	1
0010	2
0011	3
0100	4
0101	5
0110	6
0111	7

Chapter 2 — Instructions: Language of the Computer — 27

## Sign Extension

- Representing a number using more bits
  - Preserve the numeric value
- In MIPS instruction set
  - addi : extend immediate value
  - lb, lh: extend loaded byte/halfword
  - beq, bne: extend the displacement
- Replicate the sign bit to the left
  - c.f. unsigned values: extend with 0s
- Examples: 8-bit to 16-bit
  - +2: 0000 0010 => 0000 0000 0000 0010
  - -2: 1111 1110 => 1111 1111 1111 1110

Chapter 2 — Instructions: Language of the Computer — 28

## Representing Instructions

- Instructions are encoded in binary
  - Called machine code
- MIPS instructions
  - Encoded as 32-bit instruction words
  - Small number of formats encoding operation code (opcode), register numbers, ...
  - Regularity!
- Register numbers
  - \$t0 – \$t7 are reg's 8 – 15
  - \$t8 – \$t9 are reg's 24 – 25
  - \$s0 – \$s7 are reg's 16 – 23

§2.5 Representing Instructions in the Computer

Chapter 2 — Instructions: Language of the Computer — 29

## MIPS R-format Instructions

op	rs	rt	rd	shamt	funct
6 bits	5 bits	5 bits	5 bits	5 bits	6 bits

### ■ Instruction fields

- op: operation code (opcode)
- rs: first source register number
- rt: second source register number
- rd: destination register number
- shamt: shift amount (00000 for now)
- funct: function code (extends opcode)

Chapter 2 — Instructions: Language of the Computer — 30

## R-format Example

op	rs	rt	rd	shamt	funct
6 bits	5 bits	5 bits	5 bits	5 bits	6 bits

add \$t0, \$s1, \$s2

special	\$s1	\$s2	\$t0	0	add
---------	------	------	------	---	-----

0	17	18	8	0	32 <sub>ten</sub>
---	----	----	---	---	-------------------

000000	10001	10010	01000	00000	100000
--------	-------	-------	-------	-------	--------

$$0000001000110010010000000100000_2 = 02324020_{16}$$

Chapter 2 — Instructions: Language of the Computer — 31

## Hexadecimal

### ■ Base 16

- Compact representation of bit strings
- 4 bits per hex digit

0	0000	4	0100	8	1000	c	1100
1	0001	5	0101	9	1001	d	1101
2	0010	6	0110	a	1010	e	1110
3	0011	7	0111	b	1011	f	1111

### ■ Example: eca8 6420

- 1110 1100 1010 1000 0110 0100 0010 0000

Chapter 2 — Instructions: Language of the Computer — 32

## MIPS I-format Instructions

op	rs	rt	constant or address
6 bits	5 bits	5 bits	16 bits

### ■ Immediate arithmetic and load/store instructions

- rt: destination -- rs source register number
- Constant:  $-2^{15}$  to  $+2^{15} - 1$
- Address: offset added to base address in rs

### ■ **Design Principle 4: Good design demands good compromises**

- Different formats complicate decoding, but allow 32-bit instructions uniformly
- Keep formats as similar as possible

Chapter 2 — Instructions: Language of the Computer — 33

## MIPS I-format Instructions

op	rs	rt	constant or address
6 bits	5 bits	5 bits	16 bits

`addi $t0, $s1, 10`

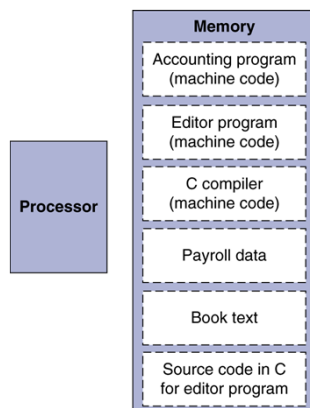

addi	\$t0	\$s1	constant
8	8	17	10
001000	10000	10001	0000000000001010

Chapter 2 — Instructions: Language of the Computer — 34

## Stored Program Computers

### The BIG Picture

- Instructions represented in binary, just like data
- Instructions and data stored in memory
- Programs can operate on programs
  - e.g., compilers, linkers, ...
- Binary compatibility allows compiled programs to work on different computers
  - Standardized ISAs

Chapter 2 — Instructions: Language of the Computer — 35

## Logical Operations

§2.6 Logical Operations

- Instructions for bitwise manipulation

Operation	C	Java	MIPS
Shift left	<<	<<	sll
Shift right	>>	>>>	srl
Bitwise AND	&	&	and, andi
Bitwise OR			or, ori
Bitwise NOT	~	~	nor

- Useful for extracting and inserting groups of bits in a word

Chapter 2 — Instructions: Language of the Computer — 36

## Shift Operations

op	rs	rt	rd	shamt	funct
6 bits	5 bits	5 bits	5 bits	5 bits	6 bits

- shamt: how many positions to shift
- Shift left logical
  - Shift left and fill with 0 bits
  - sll by  $i$  bits multiplies by  $2^i$
- Shift right logical
  - Shift right and fill with 0 bits
  - srl by  $i$  bits divides by  $2^i$  (unsigned only)

Chapter 2 — Instructions: Language of the Computer — 37

## AND Operations

- Useful to mask bits in a word
    - Select some bits, clear others to 0
- and \$t0, \$t1, \$t2

\$t2	0000 0000 0000 0000 0000 1101 1100 0000
\$t1	0000 0000 0000 0000 0011 1100 0000 0000
\$t0	0000 0000 0000 0000 0000 1100 0000 0000

Chapter 2 — Instructions: Language of the Computer — 38

## OR Operations

- Useful to include bits in a word
    - Set some bits to 1, leave others unchanged
- or \$t0, \$t1, \$t2

\$t2	0000 0000 0000 0000 0000 1101 1100 0000
\$t1	0000 0000 0000 0000 0011 1100 0000 0000
\$t0	0000 0000 0000 0000 0011 1101 1100 0000

Chapter 2 — Instructions: Language of the Computer — 39

## NOT Operations

- Useful to invert bits in a word
  - Change 0 to 1, and 1 to 0
- MIPS has NOR 3-operand instruction
  - $a \text{ NOR } b == \text{NOT} (a \text{ OR } b)$

`nor $t0, $t1, $zero` ←

Register 0: always read as zero

\$zero	0000 0000 0000 0000 0000 0000 0000 0000
\$t1	0000 0000 0000 0000 0011 1100 0000 0000
\$t0	1111 1111 1111 1111 1100 0011 1111 1111

## Conditional Operations

- Branch to a labeled instruction if a condition is true
  - Otherwise, continue sequentially
- `beq rs, rt, L1`
  - if  $(rs == rt)$  branch to instruction labeled L1;
- `bne rs, rt, L1`
  - if  $(rs != rt)$  branch to instruction labeled L1;
- `j L1`
  - unconditional jump to instruction labeled L1

## Compiling If Statements

### ■ C code:

```
if (i == j) f = g+h;
else f = g-h;
```

- f, g, ... in \$s0, \$s1, ...

### ■ Compiled MIPS code:

```

        bne $s3, $s4, Else
        add $s0, $s1, $s2
        j   Exit
Else:   sub $s0, $s1, $s2
Exit:   ...

```

Assembler calculates addresses

Chapter 2 — Instructions: Language of the Computer — 42

## Compiling Loop Statements

### ■ C code:

```
while (save[i] == k) i += 1;
```

- i in \$s3, k in \$s5, address of save in \$s6

### ■ Compiled MIPS code:

```

Loop:  sll $t1, $s3, 2
        add $t1, $t1, $s6
        lw  $t0, 0($t1)
        bne $t0, $s5, Exit
        addi $s3, $s3, 1
        j   Loop
Exit:   ...

```

Multiply i by 4

Address of save[i]

Chapter 2 — Instructions: Language of the Computer — 43

## Basic Blocks

- A basic block is a sequence of instructions with

- No embedded branches (except at end)
- No branch targets (except at beginning)

- A compiler identifies basic blocks for optimization
- An advanced processor can accelerate execution of basic blocks

Chapter 2 — Instructions: Language of the Computer — 44

## Compiling Case Statement

```
switch (k) {
  case 0: h=i+j; break; /*k=0*/
  case 1: h=i+h; break; /*k=1*/
  case 2: h=i-j; break; /*k=2*/
}
```

- Assuming three sequential words in memory starting at the address in \$t4 have the addresses of the labels L0, L1, and L2 and **k** is in **\$s2**

Memory

```

      add    $t1, $s2, $s2      # $t1 = 2*k
      add    $t1, $t1, $t1      # $t1 = 4*k
      add    $t1, $t1, $t4      # $t1 = addr of JumpT[k]
      lw     $t0, 0($t1)        # $t0 = JumpT[k]
      jr     $t0                # jump based on $t0
L0:    add    $s3, $s0, $s1      # k=0 so h=i+j
      j      Exit
L1:    add    $s3, $s0, $s3      # k=1 so h=i+h
      j      Exit
L2:    sub    $s3, $s0, $s1      # k=2 so h=i-j
Exit:  . . .
```

Chapter 2 — Instructions: Language of the Computer — 45

## More Conditional Operations

- Set `dest` to 1 if a condition is true
  - Otherwise, set to 0
- `slt rd, rs, rt`
  - if ( $rs < rt$ )  $rd = 1$ ; else  $rd = 0$ ;
- `slti rt, rs, constant`
  - if ( $rs < \text{constant}$ )  $rt = 1$ ; else  $rt = 0$ ;
- Use in combination with `beq`, `bne`

```

slt $t0, $s1, $s2 # if ($s1 < $s2)
bne $t0, $zero, L # branch to L

```

Chapter 2 — Instructions: Language of the Computer — 46

## Branch Instruction Design

- Why not `blt`, `bge`, etc?
- Hardware for  $<$ ,  $\geq$ , ... slower than  $=$ ,  $\neq$ 
  - Combining with branch involves more work per instruction, requiring a slower clock
  - All instructions penalized!
- `beq` and `bne` are the common case
- This is a good design compromise

Chapter 2 — Instructions: Language of the Computer — 47

## Signed vs. Unsigned

- Signed comparison: `sl t, sl ti`
- Unsigned comparison: `sl tu, sl tui`
- Example
  - `$s0 = 1111 1111 1111 1111 1111 1111 1111 1111`
  - `$s1 = 0000 0000 0000 0000 0000 0000 0000 0001`
  - `sl t $t0, $s0, $s1 # signed`
    - $-1 < +1 \Rightarrow \$t0 = 1$
  - `sl tu $t0, $s0, $s1 # unsigned`
    - $+4,294,967,295 > +1 \Rightarrow \$t0 = 0$
