

Chapter 3

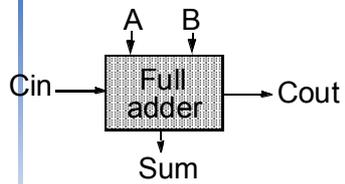

Arithmetic Circuits

Instructor: Prof. Peter Lian
Department of Electrical
Engineering & Computer Science
Lassonde School of Engineering
York University

Adders

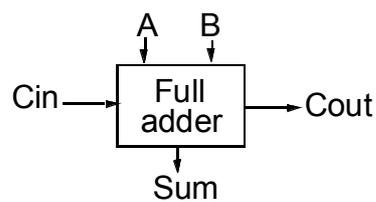

Ripple-Carry Adder
Carry-Bypass Adder
Carry-Select Adder
Carry-Lookahead Adder

Full-Adder

A	B	C_i	S	C_o	<i>Carry status</i>
0	0	0	0	0	delete
0	0	1	1	0	delete
0	1	0	1	0	propagate
0	1	1	0	1	propagate
1	0	0	1	0	propagate
1	0	1	0	1	propagate
1	1	0	0	1	generate
1	1	1	1	1	generate

The Binary Adder

$$\begin{aligned}
 S &= A \oplus B \oplus C_i \\
 &= A\bar{B}\bar{C}_i + \bar{A}B\bar{C}_i + \bar{A}\bar{B}C_i + ABC_i \\
 C_o &= AB + BC_i + AC_i
 \end{aligned}$$

Generate, Propagate, and Delete

Define 3 new variable which ONLY depend on A, B

$$\text{Generate (G)} = AB$$

$$\text{Propagate (P)} = A \oplus B$$

$$\text{Delete} = A B$$

$$C_o(G, P) = G + PC_i$$

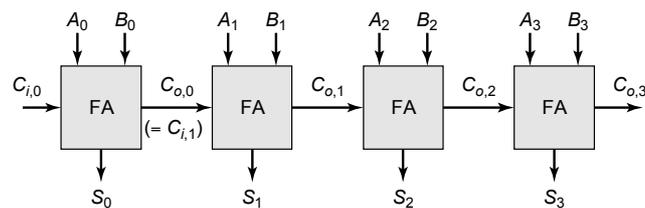

$$S(G, P) = P \oplus C_i$$

Can also derive expressions for S and C_o based on D and P

Note that we will be sometimes using an alternate definition for

$$\text{Propagate (P)} = A + B$$

The Ripple-Carry Adder

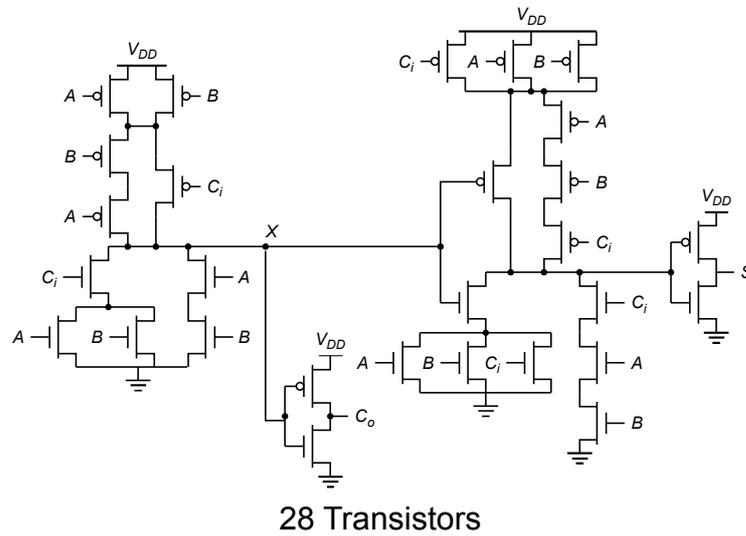

Worst case delay linear with the number of bits

$$t_d = O(N)$$

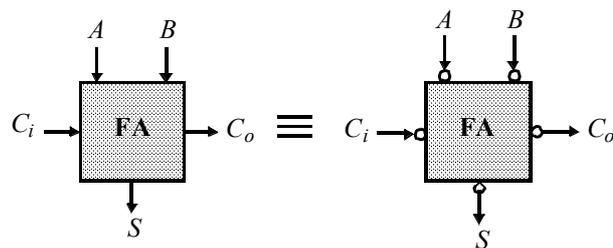

$$t_{adder} = (N-1)t_{carry} + t_{sum}$$

Goal: Make the fastest possible carry path circuit

Complimentary Static CMOS Full Adder

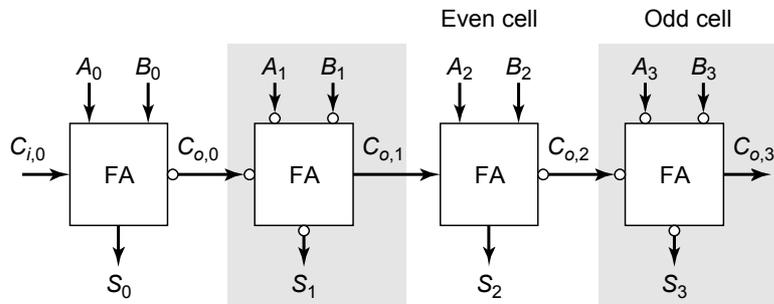

Inversion Property

$$\bar{S}(A, B, C_i) = S(\bar{A}, \bar{B}, \bar{C}_i)$$

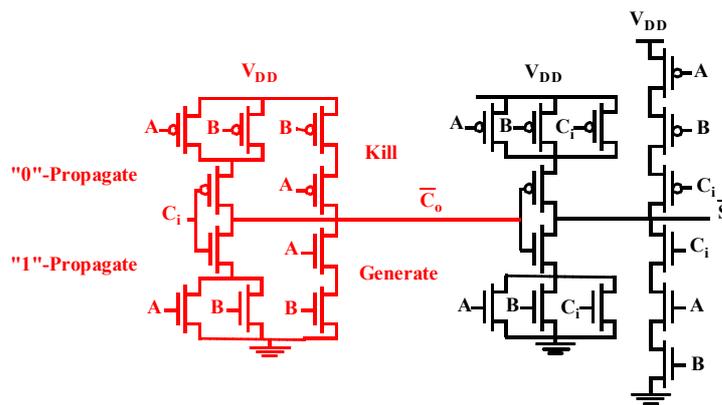

$$\bar{C}_o(A, B, C_i) = C_o(\bar{A}, \bar{B}, \bar{C}_i)$$

Minimize Critical Path by Reducing Inverting Stages

Exploit Inversion Property

A Better Structure: The Mirror Adder

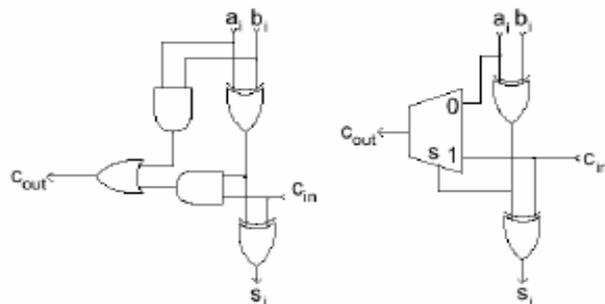

24 transistors

Notes on the Mirror Adder

- The NMOS and PMOS chains are **completely symmetrical**. A maximum of two series transistors can be observed in the carry-generation circuitry.
- When laying out the cell, the most critical issue is the minimization of the capacitance at node C_o . The reduction of the diffusion capacitances is particularly important.
- The capacitance at node C_o is composed of four diffusion capacitances, two internal gate capacitances, and six gate capacitances in the connecting adder cell .
- The transistors connected to C_i are placed closest to the output.
- Only the transistors in the carry stage have to be optimized for optimal speed.

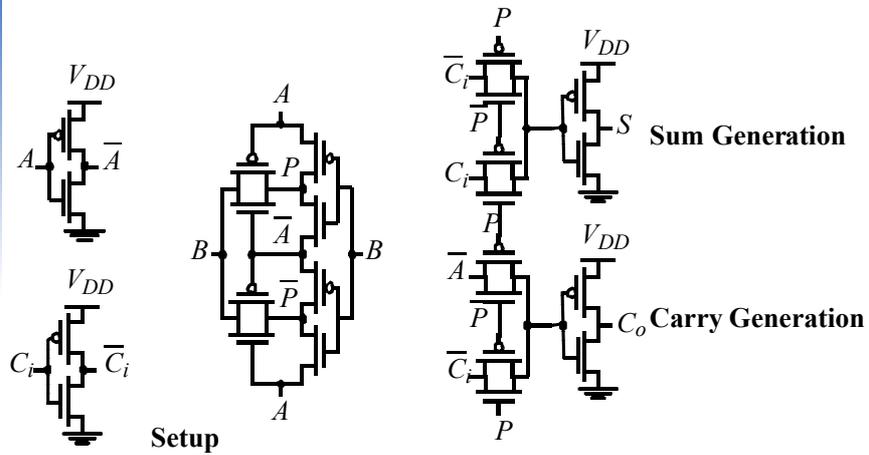

Full Adder Implementation

Standard CMOS

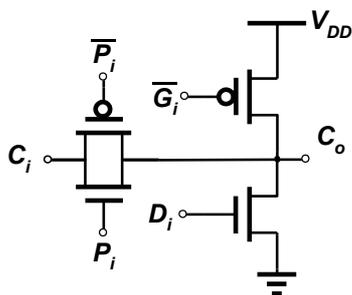

Multiplexer-based

Transmission Gate Full Adder

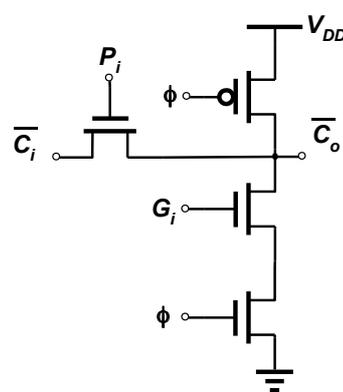

Manchester Carry Chain

Static

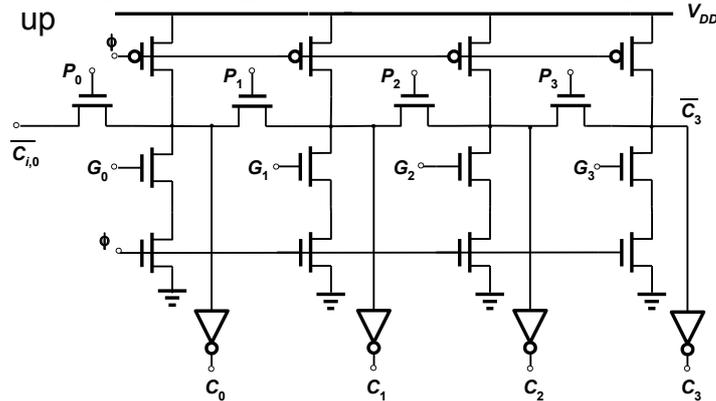

Dynamic

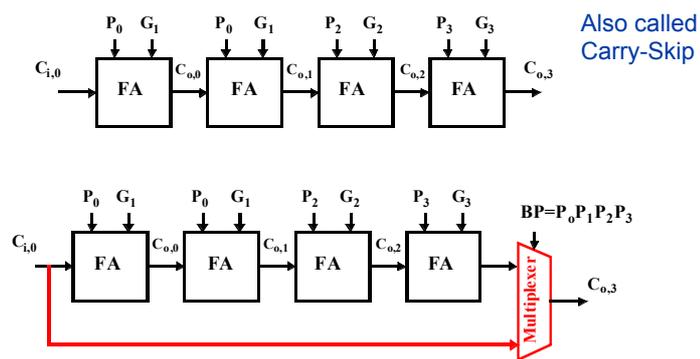

Manchester Carry Chain

- Implement P with pass-transistors
- Implement G with pull-up, delete with pull-down
- Use dynamic logic to reduce the complexity and speed up

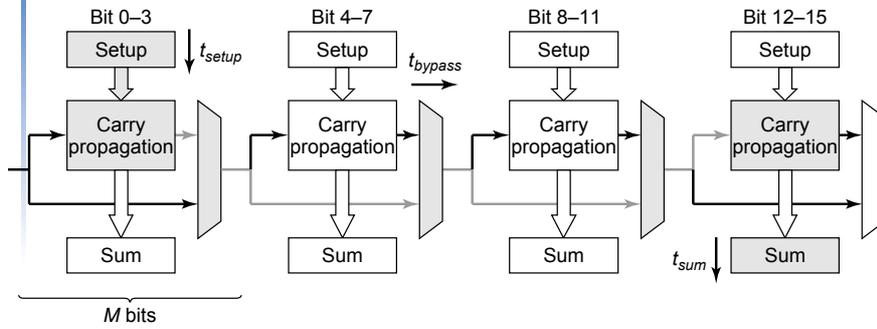

Carry-Bypass Adder

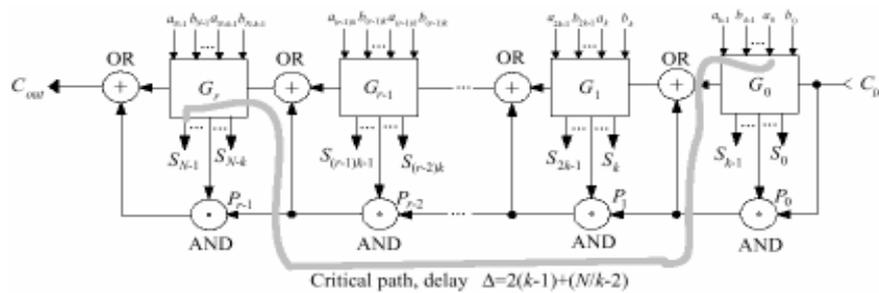

Idea: If (P_0 and P_1 and P_2 and $P_3 = 1$)
then $C_{o3} = C_0$, else "kill" or "generate".

Carry-Bypass Adder

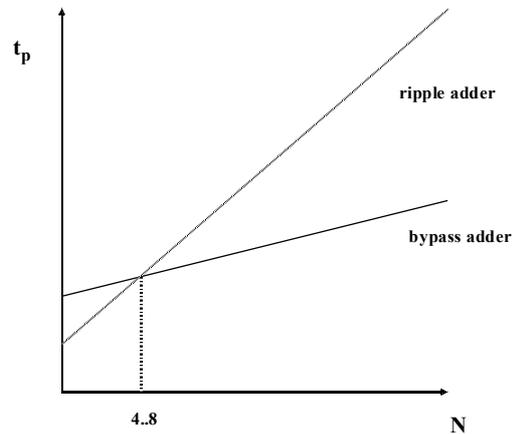

$$t_{adder} = t_{setup} + M t_{carry} + (N/M - 1) t_{bypass} + (M - 1) t_{carry} + t_{sum}$$

Carry-Bypass Adder

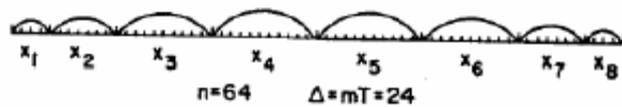

Carry Ripple vs. Carry-Bypass

Carry-Bypass Adder

Variable Group Length

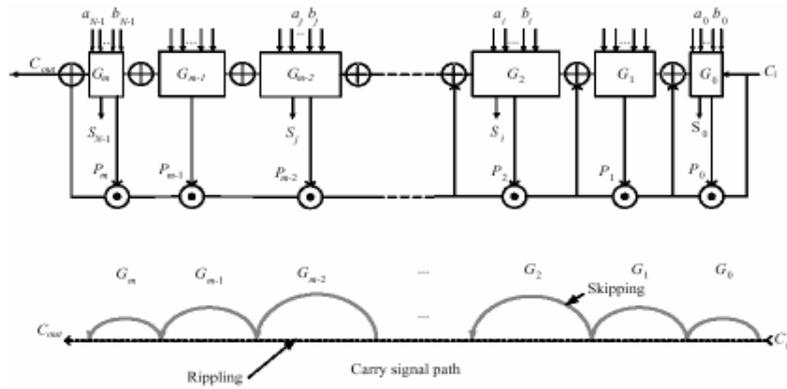

$$x_1 = x_4 = 4, \quad x_2 = x_7 = 7, \quad x_3 = x_6 = 10, \quad x_4 = x_5 = 11.$$

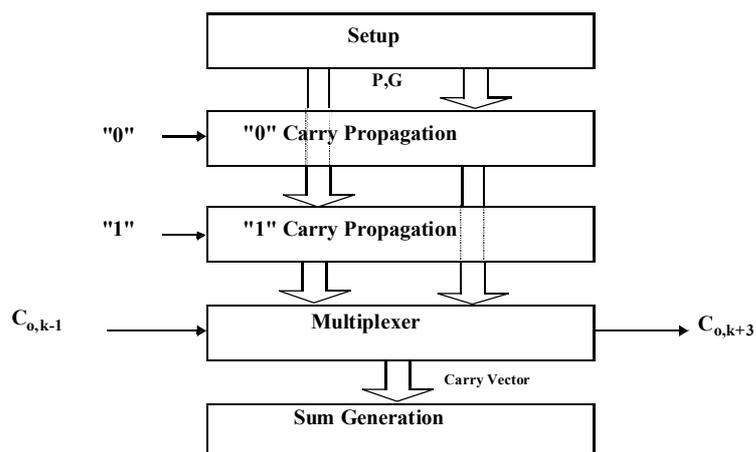

$$t_d = c_1 + \sqrt{c_2 N + c_3}$$

Oklobdzija, Barnes, Arith'85

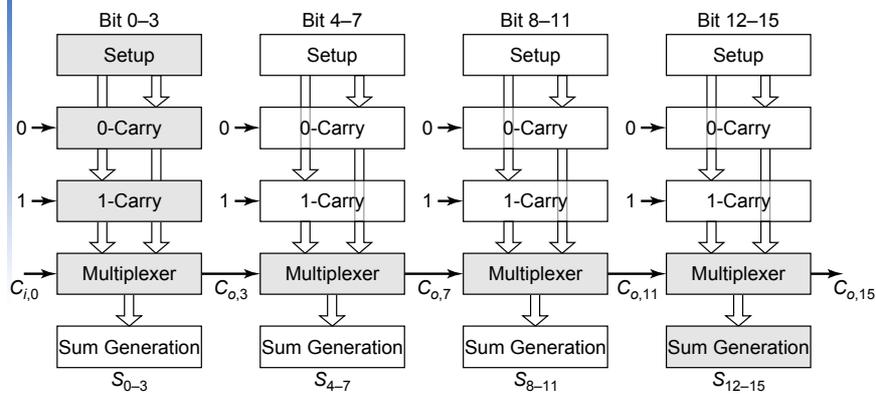

Carry-Bypass Adder

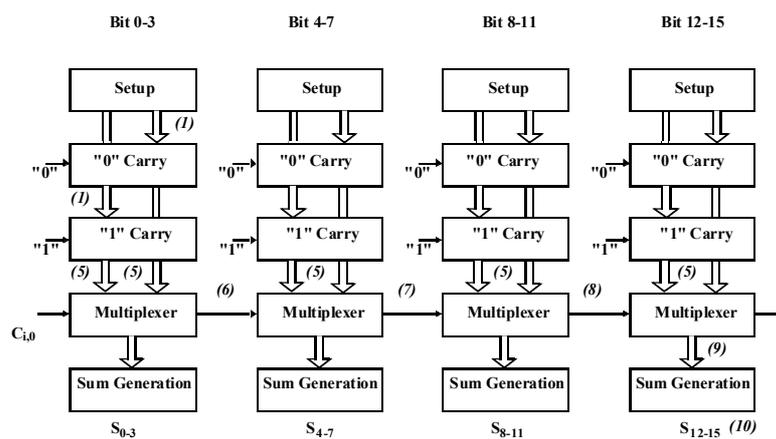

Carry-Select Adder

CSA: Critical Path

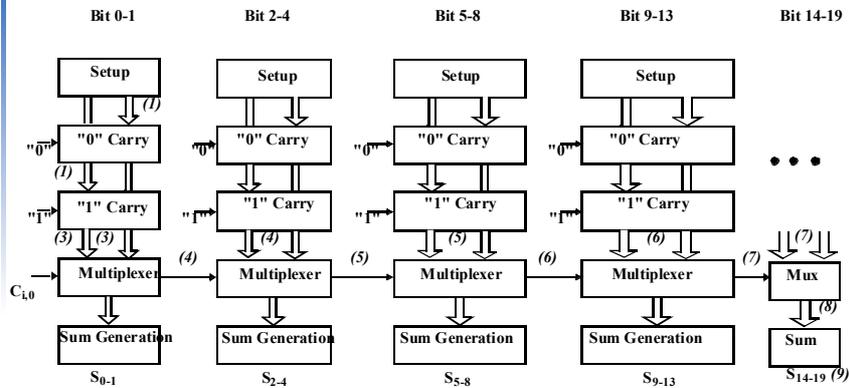

Linear Carry Select

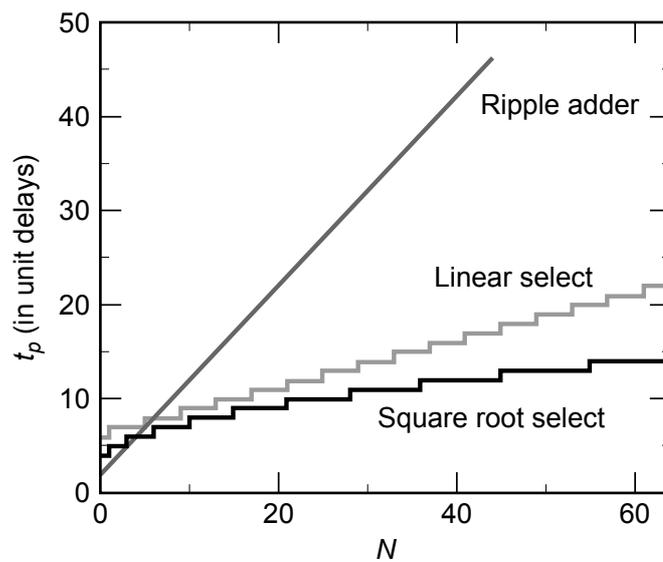

$$t_{add} = t_{setup} + \left(\frac{N}{M}\right)t_{carry} + Mt_{mux} + t_{sum}$$

Square Root Carry Select

$$t_{add} = t_{setup} + P \cdot t_{carry} + (\sqrt{2N})t_{mux} + t_{sum}$$

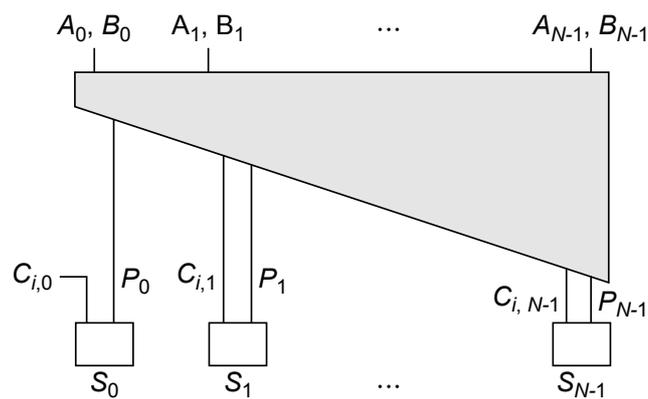

Adder Delays - Comparison

Carry-Lookahead Adders

- Carry-Lookahead Adder – CLA
- Adder trees
 - Radix of a tree
 - Minimum depth trees
 - Sparse trees
- Logic manipulation
 - Conventional vs. Ling
 - Stack height limiting

LookAhead - Basic Idea

$$C_{o,k} = f(A_k, B_k, C_{o,k-1}) = G_k + P_k C_{o,k-1}$$

Generate and Propagate

Define 3 new variable which ONLY depend on A, B

$$\text{Generate (G)} = AB$$

$$\text{Propagate (P)} = A \oplus B$$

$$\text{Delete} = A B$$

$$C_o(G, P) = G + PC_i$$

$$S(G, P) = P \oplus C_i$$

Can also derive expressions for S and C_o based on D and P

Note that we will be sometimes using an alternate definition for

$$\text{Propagate (P)} = A + B$$

Lookahead Adder

Lookahead Equations

$$\text{Position } i: \quad C_i = g_i + p_i C_{i-1}$$

$$\begin{aligned} \text{Position } i+1: \quad C_{i+1} &= g_{i+1} + p_{i+1} C_i \\ &= g_{i+1} + p_{i+1} (g_i + p_i C_{i-1}) \\ &= g_{i+1} + p_{i+1} g_i + p_{i+1} p_i C_{i-1} \end{aligned}$$

Carry exists if:

- Generated in stage $i+1$
- Generated in stage i and propagated through $i+1$
- Propagated through both i and $i+1$

Block Lookahead

- Example for 4th bit carry:

$$c_{i+4} = g_{i+3} + p_{i+3}g_{i+2} + p_{i+3}p_{i+2}g_{i+1} + p_{i+3}p_{i+2}p_{i+1}g_i + p_{i+3}p_{i+2}p_{i+1}p_i c_{i-1}$$

- Block generate and block propagate:

$$G_{i,i+3} = g_{i+3} + p_{i+3}g_{i+2} + p_{i+3}p_{i+2}g_{i+1} + p_{i+3}p_{i+2}p_{i+1}g_i$$

$$P_{i,i+3} = p_{i+3}p_{i+2}p_{i+1}p_i$$

$$c_{i+4} = G_{i,i+3} + P_{i,i+3}c_{i-1}$$

Look-Ahead: Topology

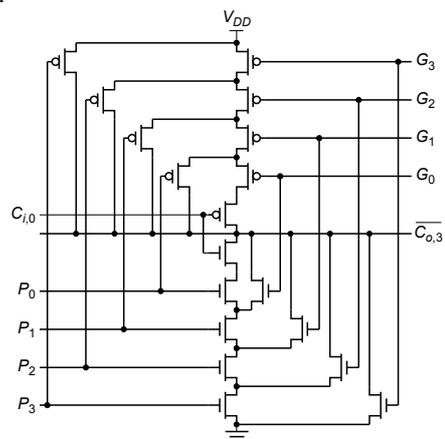

Expanding Lookahead equations:

$$C_{o,k} = G_k + P_k(G_{k-1} + P_{k-1}C_{o,k-2})$$

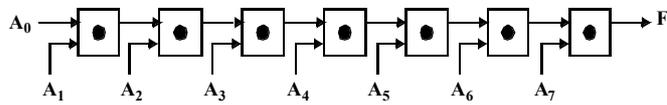

All the way:

$$C_{o,k} = G_k + P_k(G_{k-1} + P_{k-1}(\dots + P_1(G_0 + P_0C_{i,0})))$$

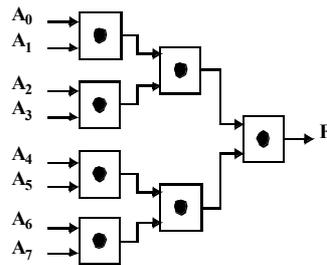

Mirror implementation

Logarithmic Look-Ahead Adder

$$t_p \sim N$$

$$t_p \sim \log_2(N)$$

Carry Lookahead Trees

$$C_{0,0} = G_0 + P_0 C_{i,0}$$

$$C_{0,1} = G_1 + P_1 G_0 + P_1 P_0 C_{i,0}$$

$$C_{0,2} = G_2 + P_2 G_1 + P_2 P_1 G_0 + P_2 P_1 P_0 C_{i,0}$$

$$= (G_2 + P_2 G_1) + (P_2 P_1)(G_0 + P_0 C_{i,0}) = G_{2,1} + P_{2,1} C_{0,0}$$

Can continue building the tree hierarchically.

Tree Adders

$$P_G = p_m \cdot p_l \quad m: \text{ more significant bit}$$

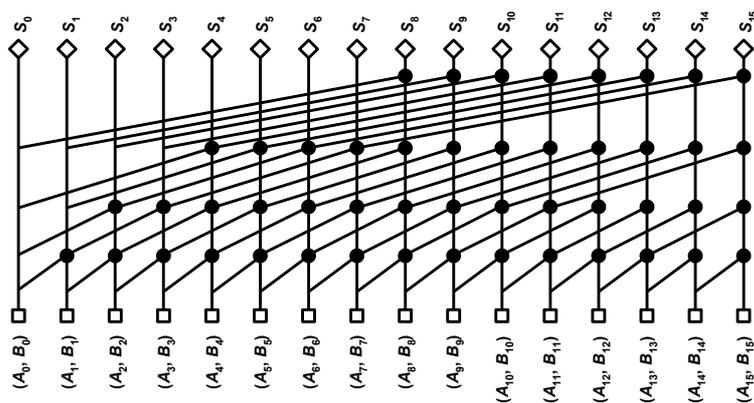

$$G_G = g_m + p_m \cdot g_l \quad l: \text{ less significant bit}$$

- Start from the input P, G and continue up the tree.

$$\begin{aligned} (g, p) &= (g_m, p_m) \bullet (g_l, p_l) \\ &= (g_m + p_m \cdot g_l, p_m \cdot p_l) \end{aligned}$$

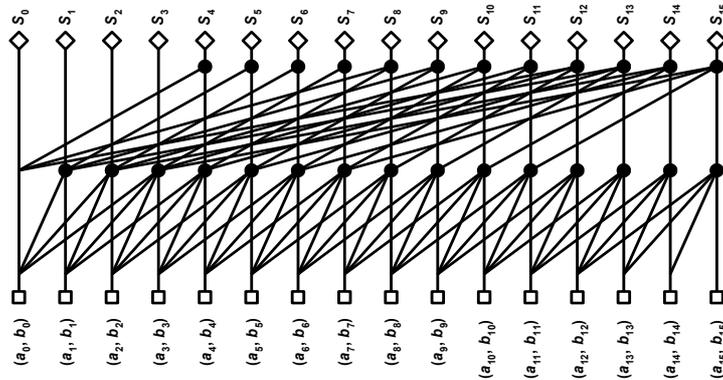

- Kogge, Stone, Trans on Comp. 1973

Tree Adders: Radix 2

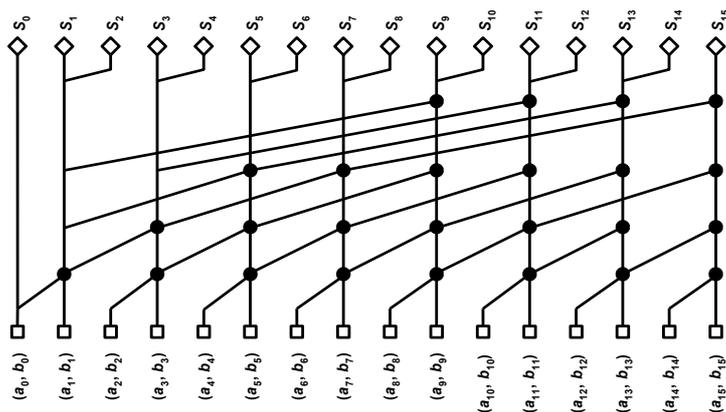

16-bit radix-2 Kogge-Stone tree

Tree Adders: Radix 4

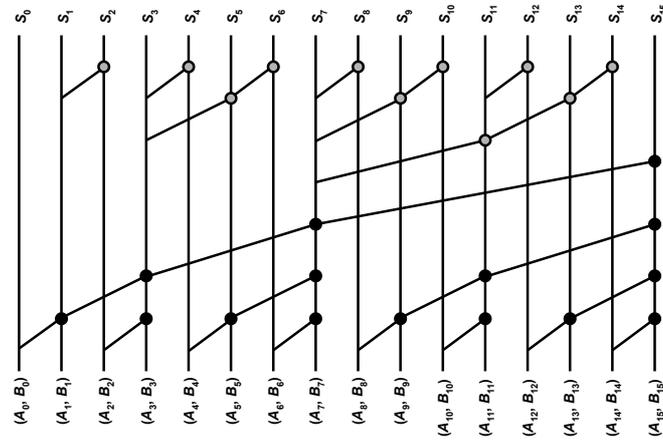

16-bit radix-4 Kogge-Stone Tree

Tree Adders: Sparse Trees

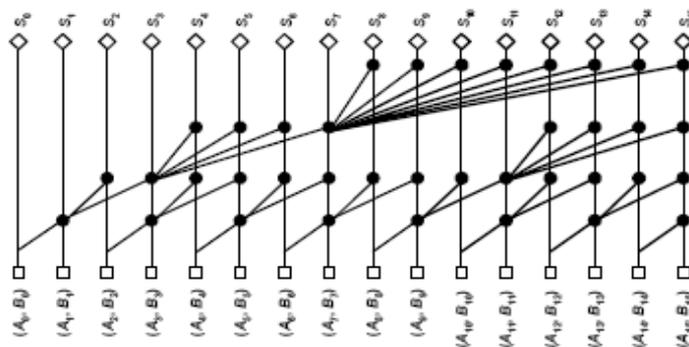

16-bit radix-2 sparse tree with sparseness of 2

Tree Adders: Brent-Kung Tree

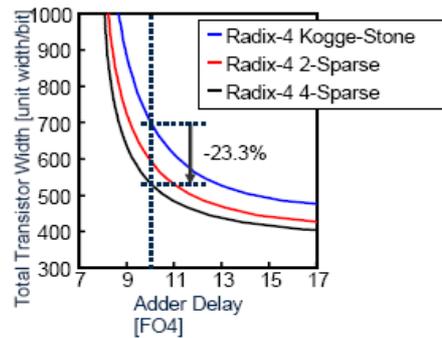

Brent-Kung Tree

Tree Adders: Ladner-Fischer

Full versus Sparse Trees

- Sparse trees have less transistors, wires – less power
- Less input loading
- Recovering missing carries – ripple or precompute
 - Complex precomputer can get into the critical path

Ling Adder

- Variation of CLA

Conventional

$$p_i = a_i \oplus b_i$$

$$g_i = a_i \cdot b_i$$

$$G_i = g_i + p_i \cdot G_{i-1}$$

$$S_i = p_i \oplus G_{i-1}$$

Ling's equations

$$t_i = a_i + b_i$$

$$g_i = a_i \cdot b_i$$

$$H_i = g_i + t_{i-1} \cdot H_{i-1}$$

$$S_i = t_i \oplus H_i + g_i t_{i-1} H_{i-1}$$

Ling, IBM J. Res. Dev., 5, 1981

Ling Adder

- Conventional radix-4

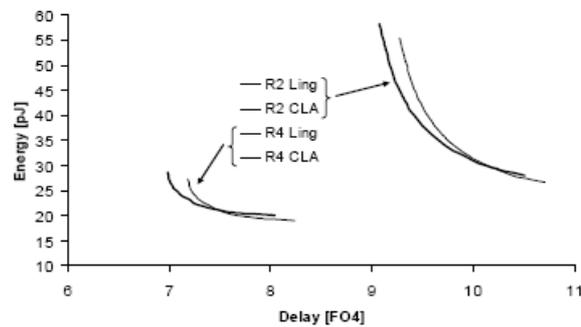

$$G_3 = g_3 + t_3g_2 + t_3t_2g_1 + t_3t_2t_1g_0$$

- Ling radix-4

$$\begin{aligned} H_3 &= g_3 + t_2g_2 + t_2t_1g_1 + t_2t_1t_0g_0 \\ &= g_3 + g_2 + t_2g_1 + t_2t_1g_0 \end{aligned}$$

- Reduces the stack height (or width)
- Reduces input loading

Ling versus CLA

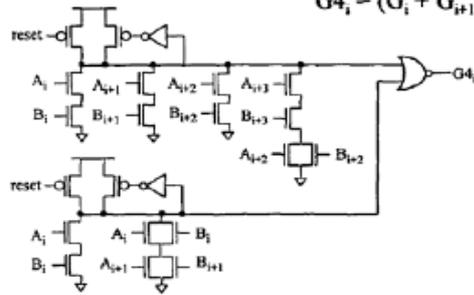

R. Zlatanovici and B. Nikolic, ESSCIRC 2003

Stack Height Limiting

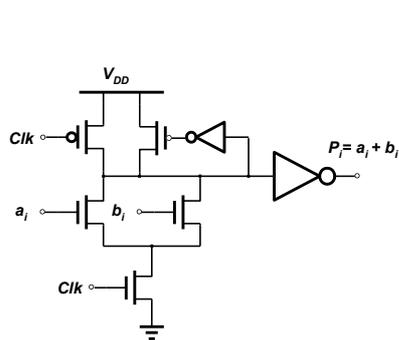

$$G4_i = G_i + P_i \cdot G_{i+1} + P_i \cdot P_{i+1} \cdot G_{i+2} + P_i \cdot P_{i+1} \cdot P_{i+2} \cdot G_{i+3}$$

$$G4_i = (G_i + G_{i+1} + G_{i+2} + P_{i+2} \cdot G_{i+3}) \cdot (G_i + P_i \cdot P_{i+1})$$

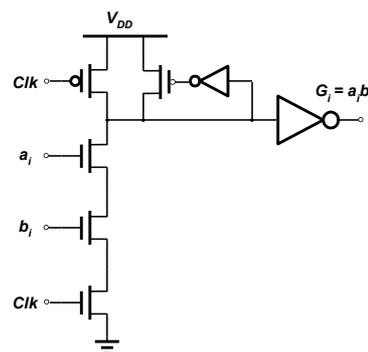

Park, VLSI Circ'00

Multipliers

The Binary Multiplication

$$\begin{aligned} Z = \bar{X} \times Y &= \sum_{k=0}^{M+N-1} Z_k 2^k \\ &= \left(\sum_{i=0}^{M-1} X_i 2^i \right) \left(\sum_{j=0}^{N-1} Y_j 2^j \right) \\ &= \sum_{i=0}^{M-1} \left(\sum_{j=0}^{N-1} X_i Y_j 2^{i+j} \right) \end{aligned}$$

with

$$\begin{aligned} X &= \sum_{i=0}^{M-1} X_i 2^i \\ Y &= \sum_{j=0}^{N-1} Y_j 2^j \end{aligned}$$

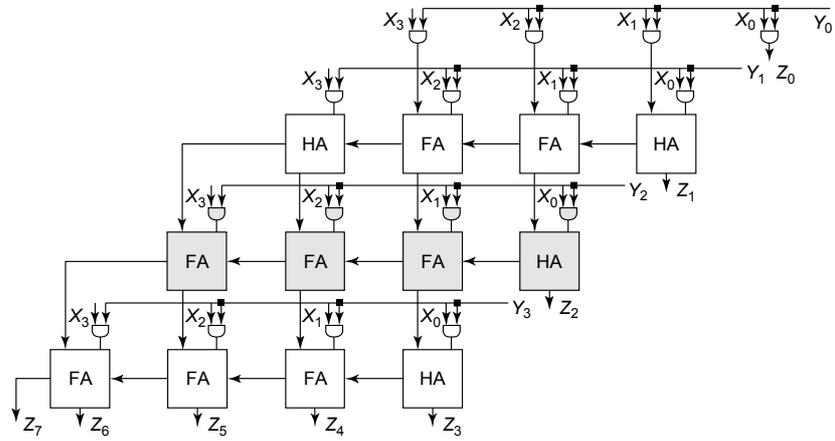

The Binary Multiplication

	1 0 1 0 1 0	Multiplicand: N bits
x	1 0 1 1	Multiplier: M bits
<hr/>		
	1 0 1 0 1 0	} AND operation
	1 0 1 0 1 0	
	0 0 0 0 0 0	} Partial products
+	1 0 1 0 1 0	
<hr/>		
	1 1 1 0 0 1 1 1 0	Result: N+M bits

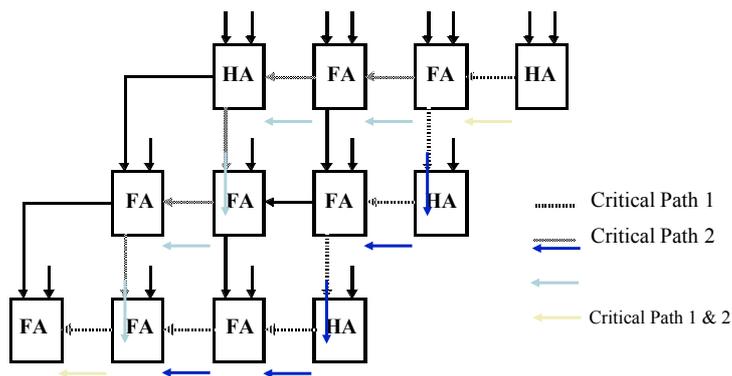

Shift-and-Add Multiplier

- Standard adder and shift-in the multiplicand
- Shift the result as well and add
- N cycles
- Parallel adders and more hardware (adders) instead.

The Array Multiplier

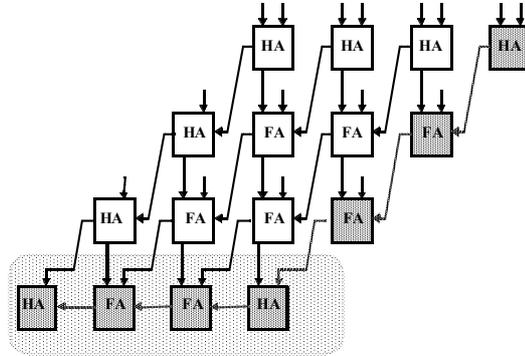

The MxN Array Multiplier— Critical Path

$$t_{mult} = [(M-1) + (N-2)]t_{carry} + (N-1)t_{sum} + (N-1)t_{and}$$

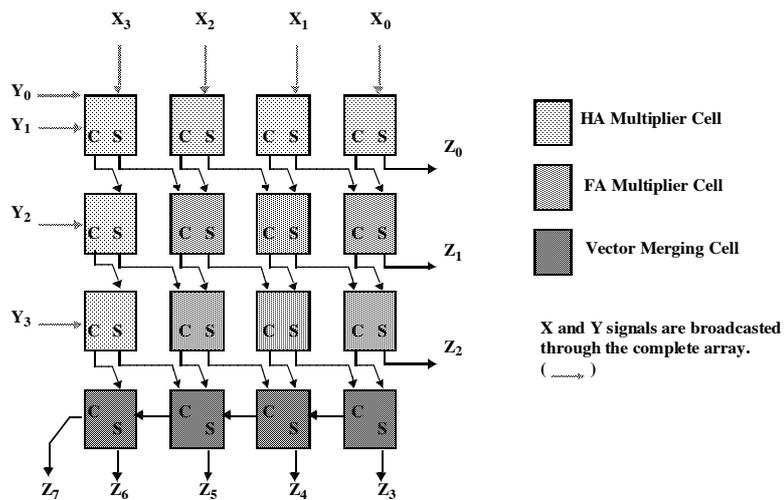

Carry-Save Multiplier

Vector Merging Adder

$$t_{mult} = (N-1)t_{carry} + (N-1)t_{and} + t_{merge}$$

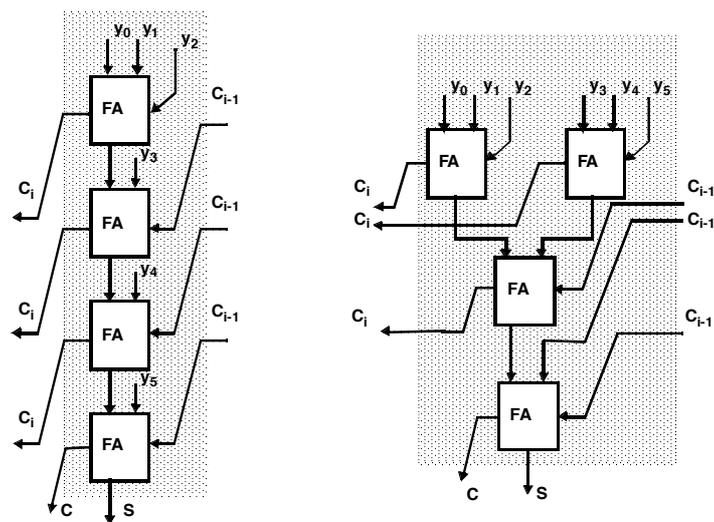

Multiplier Floorplan

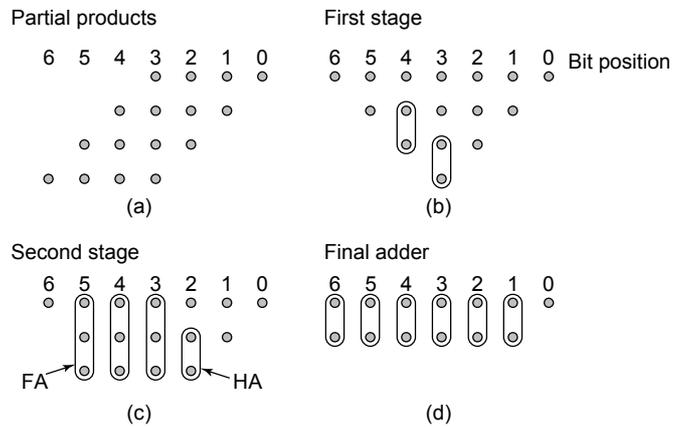

Multipliers

- Partial product generation
- Partial product accumulation
- Final summation

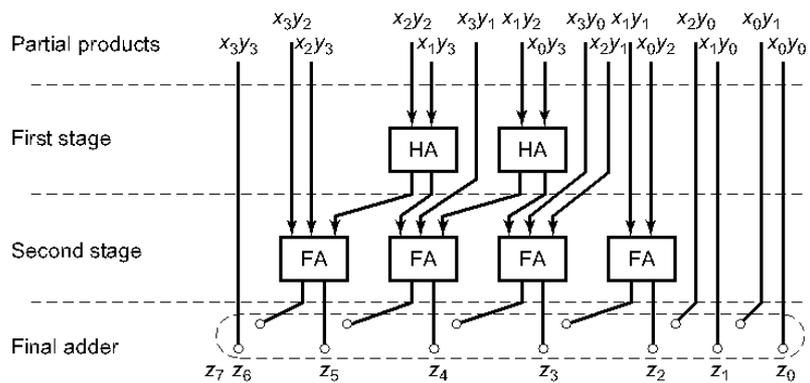

Wallace-Tree Multiplier

Wallace-Tree Multiplier

Wallace-Tree Multiplier

Multipliers —Summary

- Optimization Goals Different Vs Binary Adder
- Once Again: Identify Critical Path
- Other possible techniques
 - Logarithmic versus Linear (Wallace Tree Mult)
 - Data encoding (Booth)
 - Pipelining
