The Earley Parsing Algorithm

Reading:

Jay Earley,

“An Efficient Context-Free Parsing Algorithm”

Comm. of the ACM vol. 13 (2), pp. 94–102

The Earley Parsing Algorithm

General Principles:

- A clever hybrid *Bottom-Up* and *Top-Down* approach
- *Bottom-Up* parsing completely guided by *Top-Down* predictions
- Maintains sets of “dotted” grammar rules that:
 - Reflect what the parser has “seen” so far
 - Explicitly predict the rules and constituents that will combine into a complete parse
- Similar to Chart Parsing - partial analyses can be shared
- Time Complexity $O(n^3)$, but better on particular sub-classes
- Developed prior to Chart Parsing, first efficient parsing algorithm for general context-free grammars.

The Earley Parsing Method

- Main Data Structure: The “*state*” (or “*item*”)
- A state is a “dotted” rule and starting position:
 $[A \rightarrow X_1 \dots \bullet C \dots X_m, p_i]$
- The algorithm maintains sets of “states”, one set for each position in the input string (starting from 0)
- We denote the set for position i by S_i

The Earley Parsing Algorithm

Three Main Operations:

- **Predictor:** If state $[A \rightarrow X_1 \dots \bullet C \dots X_m, j] \in S_i$ then for every rule of the form $C \rightarrow Y_1 \dots Y_k$, add to S_i the state $[C \rightarrow \bullet Y_1 \dots Y_k, i]$
- **Completer:** If state $[A \rightarrow X_1 \dots X_m \bullet, j] \in S_i$ then for every state in S_j of form $[B \rightarrow X_1 \dots \bullet A \dots X_k, l]$, add to S_i the state $[B \rightarrow X_1 \dots A \bullet \dots X_k, l]$
- **Scanner:** If state $[A \rightarrow X_1 \dots \bullet a \dots X_m, j] \in S_i$ and the next input word is $x_{i+1} = a$, then add to S_{i+1} the state $[A \rightarrow X_1 \dots a \bullet \dots X_m, j]$

The Earley Recognition Algorithm

- Simplified version with no lookaheads and for grammars without epsilon-rules
- Assumes input is string of grammar terminal symbols
- We extend the grammar with a new rule $S' \rightarrow S \$$
- The algorithm sequentially constructs the sets S_i for $0 \leq i \leq n + 1$
- We initialize the set S_0 with $S_0 = \{[S' \rightarrow \bullet S \$, 0]\}$

The Earley Recognition Algorithm

The Main Algorithm: parsing input $x = x_1 \dots x_n$

1. $S_0 = \{[S' \rightarrow \bullet S \$, 0]\}$
2. For $0 \leq i \leq n$ do:
Process each item $s \in S_i$ in order by applying to it the *single* applicable operation among:
 - (a) Predictor (adds new items to S_i)
 - (b) Completer (adds new items to S_i)
 - (c) Scanner (adds new items to S_{i+1})
3. If $S_{i+1} = \phi$, *Reject* the input
4. If $i = n$ and $S_{n+1} = \{[S' \rightarrow S \$\bullet, 0]\}$ then *Accept* the input

Earley Recognition - Example

The Grammar:

- (1) $S \rightarrow NP VP$
- (2) $NP \rightarrow art adj n$
- (3) $NP \rightarrow art n$
- (4) $NP \rightarrow adj n$
- (5) $VP \rightarrow aux VP$
- (6) $VP \rightarrow v NP$

The original input: “ x = The large can can hold the water”

POS assigned input: “ x = art adj n aux v art n”

Parser input: “ x = art adj n aux v art n \$”

Earley Recognition - Example

The input: “ $x = \mathbf{art\ adj\ n\ aux\ v\ art\ n\ \$}$ ”

S_0 : $[S' \rightarrow \bullet S\ \$, 0]$
 $[S \rightarrow \bullet NP\ VP , 0]$
 $[NP \rightarrow \bullet art\ adj\ n , 0]$
 $[NP \rightarrow \bullet art\ n , 0]$
 $[NP \rightarrow \bullet adj\ n , 0]$

S_1 : $[NP \rightarrow art\ \bullet adj\ n , 0]$
 $[NP \rightarrow art\ \bullet n , 0]$

Earley Recognition - Example

The input: “ $x = \text{art } \mathbf{adj} \text{ } n \text{ aux } v \text{ art } n \text{ \$}$ ”

S_1 : $[NP \rightarrow \text{art } \bullet \text{adj } n , 0]$
 $[NP \rightarrow \text{art } \bullet n , 0]$

S_2 : $[NP \rightarrow \text{art } \text{adj} \bullet n , 0]$

Earley Recognition - Example

The input: “ $x = \text{art adj n aux v art n } \$$ ”

$S_2: [NP \rightarrow \text{art adj } \bullet \text{ n}, 0]$

$S_3: [NP \rightarrow \text{art adj n } \bullet, 0]$

Earley Recognition - Example

The input: “ $x = \text{art adj n aux v art n \$}$ ”

S_3 : [$NP \rightarrow \text{art adj n } \bullet$, 0]

[$S \rightarrow NP \bullet VP$, 0]

[$VP \rightarrow \bullet \text{aux } VP$, 3]

[$VP \rightarrow \bullet v NP$, 3]

S_4 : [$VP \rightarrow \text{aux } \bullet VP$, 3]

Earley Recognition - Example

The input: “ $x = \text{art adj n aux } \mathbf{v} \text{ art n } \$$ ”

S_4 : [$VP \rightarrow aux \bullet VP$, 3]

[$VP \rightarrow \bullet aux VP$, 4]

[$VP \rightarrow \bullet v NP$, 4]

S_5 : [$VP \rightarrow v \bullet NP$, 4]

Earley Recognition - Example

The input: “ $x = \text{art adj n aux v art n \$}$ ”

S_5 : $[VP \rightarrow v \bullet NP, 4]$
 $[NP \rightarrow \bullet \text{art adj } n, 5]$
 $[NP \rightarrow \bullet \text{art } n, 5]$
 $[NP \rightarrow \bullet \text{adj } n, 5]$

S_6 : $[NP \rightarrow \text{art} \bullet \text{adj } n, 5]$
 $[NP \rightarrow \text{art} \bullet n, 5]$

Earley Recognition - Example

The input: “ $x = \text{art adj n aux v art n } \$$ ”

S_6 : [$NP \rightarrow \text{art} \bullet \text{adj } n$, 5]
 [$NP \rightarrow \text{art} \bullet n$, 5]

S_7 : [$NP \rightarrow \text{art } n \bullet$, 5]

Earley Recognition - Example

The input: “ $x = \text{art adj n aux v art n \$}$ ”

S_7 : $[NP \rightarrow \text{art } n \bullet, 5]$
 $[VP \rightarrow v \ NP \bullet, 4]$
 $[VP \rightarrow \text{aux } VP \bullet, 3]$
 $[S \rightarrow NP \ VP \bullet, 0]$
 $[S' \rightarrow S \bullet \ \$, 0]$

S_8 : $[S' \rightarrow S \ \$ \bullet, 0]$

Time Complexity of Earley Algorithm

- Algorithm iterates for each word of input (i.e. n iterations)
- How many items can be created and processed in S_i ?
 - Each item in S_i has the form $[A \rightarrow X_1 \dots \bullet C \dots X_m, j]$,
 $0 \leq j \leq i$
 - Thus $O(n)$ items
- The *Scanner* and *Predictor* operations on an item each require constant time
- The *Completer* operation on an item adds items of form $[B \rightarrow X_1 \dots A \bullet \dots X_k, l]$ to S_i , with $0 \leq l \leq i$, so it may require up to $O(n)$ time for each processed item
- Time required for each iteration (S_i) is thus $O(n^2)$
- Time bound on entire algorithm is therefore $O(n^3)$

Time Complexity of Earley Algorithm

Special Cases:

- *Completer* is the operation that may require $O(i^2)$ time in iteration i
- For unambiguous grammars, Earley shows that the completer operation will require at most $O(i)$ time
- Thus time complexity for unambiguous grammars is $O(n^2)$
- For some grammars, the number of items in each S_i is bounded by a *constant*
- These are called *bounded-state* grammars and include even some ambiguous grammars.
- For bounded-state grammars, the time complexity of the algorithm is linear - $O(n)$

Parsing with an Earley Parser

- As usual, we need to keep back-pointers to the constituents that we combine together when we complete a rule
- Each item must be extended to have the form $[A \rightarrow X_1(pt_1) \dots \bullet C \dots X_m, j]$, where the pt_i are “pointers” to the already found RHS sub-constituents
- At the end - reconstruct parse from the “back-pointers”
- To maintain efficiency - we must do ambiguity packing

Earley Parsing - Example

The input: “ $x =$ art adj n aux v art n \$”

Earley Parsing - Example

The input: “ $x = \mathbf{art\ adj\ n\ aux\ v\ art\ n\ \$}$ ”

S_0 : $[S' \rightarrow \bullet S \$, 0]$
 $[S \rightarrow \bullet NP VP , 0]$
 $[NP \rightarrow \bullet art\ adj\ n , 0]$
 $[NP \rightarrow \bullet art\ n , 0]$
 $[NP \rightarrow \bullet adj\ n , 0]$

S_1 : $[NP \rightarrow art_1 \bullet adj\ n , 0]$ 1 art
 $[NP \rightarrow art_1 \bullet n , 0]$

Earley Parsing - Example

The input: “ $x = \text{art } \mathbf{adj} \text{ } n \text{ aux } v \text{ art } n \text{ \$}$ ”

S_1 : $[NP \rightarrow \text{art}_1 \bullet \text{adj } n, 0]$
 $[NP \rightarrow \text{art}_1 \bullet n, 0]$

S_2 : $[NP \rightarrow \text{art}_1 \text{adj}_2 \bullet n, 0]$ 2 adj

Earley Parsing - Example

The input: “ $x = \text{art adj n aux v art n } \$$ ”

$S_2: [NP \rightarrow \text{art}_1 \text{adj}_2 \bullet n, 0]$

$S_3: [NP_4 \rightarrow \text{art}_1 \text{adj}_2 n_3 \bullet, 0]$

3 n

4 $NP \rightarrow \text{art}_1 \text{adj}_2 n_3$

Earley Parsing - Example

The input: “ $x = \text{art adj n aux v art n \$}$ ”

S_3 : [$NP_4 \rightarrow \text{art}_1 \text{adj}_2 \text{n}_3 \bullet$, 0]

[$S \rightarrow NP_4 \bullet VP$, 0]

[$VP \rightarrow \bullet \text{aux} VP$, 3]

[$VP \rightarrow \bullet v NP$, 3]

S_4 : [$VP \rightarrow \text{aux}_5 \bullet VP$, 3]

5 aux

Earley Parsing - Example

The input: “ $x = \text{art adj n aux } \mathbf{v} \text{ art n } \$$ ”

S_4 : $[VP \rightarrow aux_5 \bullet VP, 3]$
 $[VP \rightarrow \bullet aux VP, 4]$
 $[VP \rightarrow \bullet v NP, 4]$

S_5 : $[VP \rightarrow v_6 \bullet NP, 4]$ 6 v

Earley Parsing - Example

The input: “ $x = \text{art adj n aux v art n \$}$ ”

S_5 : $[VP \rightarrow v_6 \bullet NP, 4]$
 $[NP \rightarrow \bullet \text{art adj } n, 5]$
 $[NP \rightarrow \bullet \text{art } n, 5]$
 $[NP \rightarrow \bullet \text{adj } n, 5]$

S_6 : $[NP \rightarrow \text{art}_7 \bullet \text{adj } n, 5]$ 7 art
 $[NP \rightarrow \text{art}_7 \bullet n, 5]$

Earley Parsing - Example

The input: “ $x = \text{art adj } n \text{ aux } v \text{ art } n \text{ \$}$ ”

S_6 : [$NP \rightarrow \text{art}_7 \bullet \text{adj } n$, 5]
 [$NP \rightarrow \text{art}_7 \bullet n$, 5]

S_7 : [$NP_9 \rightarrow \text{art}_7 n_8 \bullet$, 5] 8 n
 9 $NP \rightarrow \text{art}_7 n_8$

Earley Parsing - Example

The input: “ $x = \text{art adj n aux v art n \$}$ ”

S_7 : [$NP_9 \rightarrow \text{art}_7 n_8 \bullet$, 5]

[$VP_{10} \rightarrow v_6 NP_9 \bullet$, 4]

[$VP_{11} \rightarrow \text{aux}_5 VP_{10} \bullet$, 3]

[$S_{12} \rightarrow NP_4 VP_{11} \bullet$, 0]

[$S' \rightarrow S \bullet \$$, 0]

10 $VP \rightarrow v_6 NP_9$

11 $VP \rightarrow \text{aux}_5 VP_{10}$

12 $S \rightarrow NP_4 VP_{11}$

S_8 : [$S' \rightarrow S \$ \bullet$, 0]
