algorithm

Deletion

The Problem of  
Concurrent Insertion  
and Deletion

Solution: Marking the  
Node

Implementation

Basic Types

The public methods

The SEARCH method

Testing

Conclusion

Future Work

- No good solution for the ABA problem arising from decoupling COMPARE&SET and READ operations.
- AtomicStampedReference<V> is slow due to being implemented as a boxed [reference, integer] pair.
- The problem of adversarial scheduling Fomitchev and Ruppert's algorithm is unlikely to be encountered in practice.
- There would be a significant performance penalty in having two operations on shared memory.
- Perhaps the most important reason...

Recall Harris's  
algorithm

Deletion

The Problem of  
Concurrent Insertion  
and Deletion

Solution: Marking the  
Node

Implementation

Basic Types

The public methods

The SEARCH method

Testing

Conclusion

Future Work

I found it too difficult then to implement Fomitchev and Ruppert's algorithm.

# SLL Operations: INSERT

CSE6490A  
Presentation

Amgad Rady

Why Harris's  
algorithm?

Recall Harris's  
algorithm

Deletion

The Problem of  
Concurrent Insertion  
and Deletion

Solution: Marking the  
Node

Implementation

Basic Types

The public methods

The SEARCH method

Testing

Conclusion

Future Work

Inserting the node containing 2 into the list  $\{1, 3, 4\}$ . First, find the appropriate successor for 2 by searching the list from the head.

# SLL Operations: INSERT

CSE6490A  
Presentation

Amgad Rady

Why Harris's  
algorithm?

Recall Harris's  
algorithm

Deletion

The Problem of  
Concurrent Insertion  
and Deletion

Solution: Marking the  
Node

Implementation

Basic Types

The public methods

The SEARCH method

Testing

Conclusion

Future Work

Inserting the node containing 2 into the list  $\{1, 3, 4\}$ . Next, swinging the pointer from the predecessor (1) to the node (2).

# SLL Operations: DELETE

CSE6490A  
Presentation

Amgad Rady

Why Harris's  
algorithm?

Recall Harris's  
algorithm

Deletion

The Problem of  
Concurrent Insertion  
and Deletion

Solution: Marking the  
Node

Implementation

Basic Types

The public methods

The SEARCH method

Testing

Conclusion

Future Work

Deleting the node containing 2 from the list  $\{1, 2, 3, 4\}$ . First, find the node's predecessor by searching the list from the head.

# SLL Operations: DELETE

CSE6490A  
Presentation

Amgad Rady

Why Harris's  
algorithm?

Recall Harris's  
algorithm

**Deletion**

The Problem of  
Concurrent Insertion  
and Deletion

Solution: Marking the  
Node

Implementation

Basic Types

The public methods

The SEARCH method

Testing

Conclusion

Future Work

Deleting the node containing 2 from the list  $\{1, 2, 3, 4\}$ .  
Next, swing (2)'s predecessor's pointer to (2)'s successor.

# Concurrent INSERT and DELETE

CSE6490A  
Presentation

Amgad Rady

Why Harris's  
algorithm?

Recall Harris's  
algorithm

Deletion

The Problem of  
Concurrent Insertion  
and Deletion

Solution: Marking the  
Node

Implementation

Basic Types

The public methods

The SEARCH method

Testing

Conclusion

Future Work

We delete the node (2) and insert the node (3) concurrently into the list  $\{1, 2, 4\}$ .

# Concurrent INSERT and DELETE

CSE6490A  
Presentation

Amgad Rady

Why Harris's  
algorithm?

Recall Harris's  
algorithm

Deletion

The Problem of  
Concurrent Insertion  
and Deletion

Solution: Marking the  
Node

Implementation

Basic Types

The public methods

The SEARCH method

Testing

Conclusion

Future Work

The resulting list is  $\{1, 4\}$ , rather than the correct  $\{1, 3, 4\}$ .

# DELETE Procedure

CSE6490A  
Presentation

Amgad Rady

Why Harris's  
algorithm?

Recall Harris's  
algorithm

Deletion

The Problem of  
Concurrent Insertion  
and Deletion

Solution: Marking the  
Node

Implementation

Basic Types

The public methods

The SEARCH method

Testing

Conclusion

Future Work

Deleting the node containing 2 from the list  $\{1, 2, 3, 4\}$ .  
Mark the node.

# DELETE Procedure

CSE6490A

The SEARCH method

Testing

Conclusion

Future Work

- I cribbed the `RedBlackTreeTest` class and modified it to work on SLL's to do preliminary correctness testing.
- All those tests passed on the first try!
- I implemented further ad hoc tests to check correctness by constructing Adder and Deleter threads and observing by their behaviour 'print debugging'.
- Not elegant, but instructive. The expected properties were validated by these tests (e.g. inserting the same element multiple times succeeds only once, inserting an element and deleting it multiple times succeeds only once, etc.)
- However, some oddities emerged...

The SEARCH method

Testing

Conclusion

Future Work

- I cribbed the RedBlackTreeTest class and modified it to work on SLL's to do preliminary correctness testing.
- All those tests passed on the first try!
- I implemented further ad hoc tests to check correctness by constructing Adder and Deleter threads and observing by their behaviour 'print debugging'.
- Not elegant, but instructive. The expected properties were validated by these tests (e.g. inserting the same element multiple times succeeds only once, inserting an element and deleting it multiple times succeeds only once, etc.)
- However, some oddities emerged...

Testing

Conclusion

Future Work

- Java's cyclic barrier appears to maintain a large degree of ordering by constructing time of the thread.
- On Add/Delete tests with 2500 of each thread, the same list is nearly always returned.
- This remains the case even when the threads are shuffled.

Solution: Marking the  
Node

Implementation

Basic Types

The public methods

The SEARCH method

Testing

Conclusion  
Future Work

- Try and understand the odd behaviour of these test cases.
- Implement F&R's algorithm (which should now be possible) and compare its performance against Harris's algorithm.
