

Implementation Report: Concurrent Genetic Algorithm with Island Migration

Markus Solbach

Laboratory for Active and Attentive Vision
Department of Computer Science and Engineering
York University, Toronto, Ontario, Canada

November 10, 2015

Overview

- Genetic Algorithm revisited
- Genetic Algorithm Operators
- Concurrency
- Some Results
- Future Work

Genetic Algorithm revisited

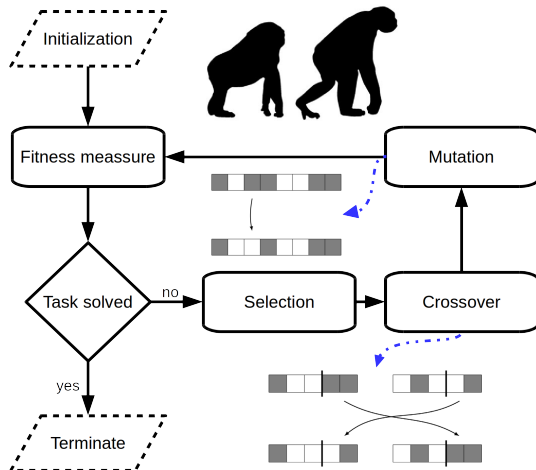

Genetic Algorithm revisited

Generation 0

Genetic Algorithm revisited

Generation n

VLSI Design Problem

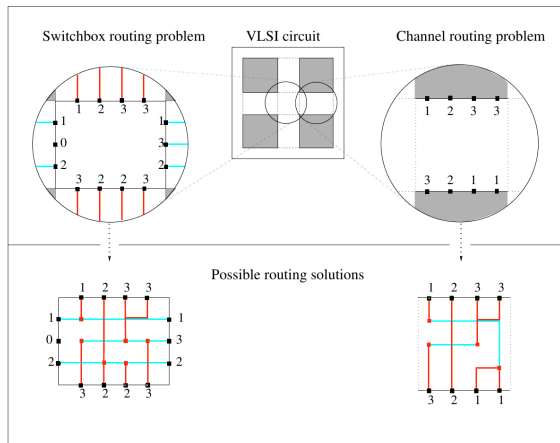

Figure :VLSI Design Problem

VLSI Design Problem - Traveling Salesman Problem

Problem changed for good reasons:

VLSI very little implementation details

VLSI faced problems had nothing to do with concurrency

TSP well known problem

TSP rich implementation details in literature (sequential)

TSP able to concentrate more on concurrency

Traveling Salesman Problem

Find a route on a map

Requirements:

- ▶ Visit each City only once
- ▶ Find shortest path

Complexity (20 city):

- ▶ $O(n!)$ (Brute Force, WC)
- ▶ $20! = 2.432902 \times 10^{18}$

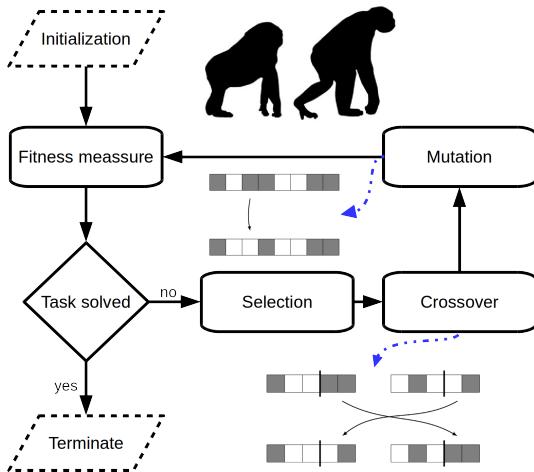

Figure :TSP Map

Genetic Algorithm Operators

Initialization

```
1 // create a random individual
2 public void generateIndividual() {
3     // Go through all available Cities and add it to the tour
4     for (int cityIndex = 0; cityIndex <
5         CGaimDestinationPool.numberOfCities(); cityIndex++) {
6         setCity(cityIndex, CGaimDestinationPool.getCity(cityIndex));
7     }
8     // shuffle the tour
9     Collections.shuffle(tour);
10 }
```

TO	BE	AM	EH	SG	KL	MA
----	----	----	----	----	----	----

Figure :High Level Individual Representation

Mutation

Figure :High Level Mutation Representation

Crossover

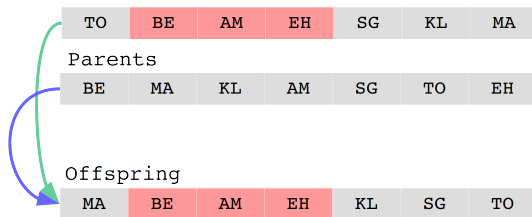

Figure :High Level Crossover Representation

Fitness Function

- ▶ Travelled distance over all city (inverse fitness)
- ▶ Each City has a location (x, y)
- ▶ Euclidean distance
- ▶ $Fitness_1 = \sum_{i=1}^n (x_{i-1} - x_i)^2 + (y_{i-1} - y_i)^2$

Concurrency

Concurrent Random Number Generator

Genetic Algorithms rely heavily on random numbers

- ▶ *Math.random()* is not concurrent
- ▶ Multiple threads use similar or same seeds
- ▶ *ThreadLocalRandom*¹
- ▶ Generator with an internally generated seed
- ▶ *java.util.concurrent.ThreadLocalRandom*

¹<http://docs.oracle.com/javase/7/docs/api/java/util/concurrent/ThreadLocalRandom.html>

Threads and Islands

Each Thread represents one Island

- ▶ Genetic Algorithm (GA) Logic
- ▶ Implements *Runnable*
- ▶ Concurrent Execution
- = GA's Island Migration extension

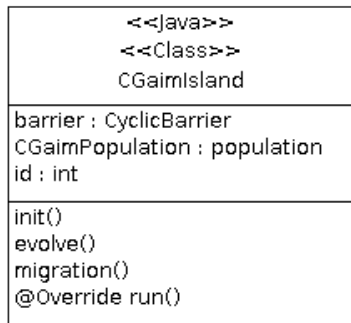

Figure :Simplified UML-Class of CGaimIsland

Threads and Islands

Each Thread represents one Island

- ▶ Genetic Algorithm (GA) Logic
- ▶ Implements *Runnable*
- ▶ Concurrent Execution
- = GA's Island Migration extension

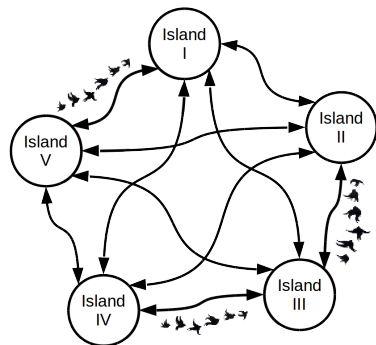

Figure :Island Migration overview

Threads and Barriers

Barriers² for synchronization

- ▶ *new CyclicBarrier(# Islands)*
- ▶ Waits that all Islands are ready
- ▶ Evolution \leftrightarrow random process

```
1 @Override
2 public void run() {
3     barrier.await();
4     /* start evolution */
5     this.evolve();
6 }
```

²<http://docs.oracle.com/javase/7/docs/api/java/util/concurrent/CyclicBarrier.html>

Island Migration

Sequentially (as proposed)

- ▶ Depends on epoch length
- ▶ Joins all Threads
- ▶ Avoids shared memory access
- ▶ Performs cyclic Migration
- ▶ Copies Individuals
- ▶ Java's `array.clone()[i]`

```
1  /* Wait for Threads */
2  for(int i = 0; i < numberIslands; i++)
3  {
4      thread[i].join();
5  }
```

Island Migration

Sequentially (as proposed)

- ▶ Depends on epoch length
- ▶ Joins all Threads
- ▶ Avoids shared memory access
- ▶ Performs cyclic Migration
- ▶ Copies Individuals
- ▶ Java's `array.clone()[i]`

```
1  /* Perform cyclic Migration */
2  island[1].setMigrants()
3      = island[0].getMigrants();
4  ...
```

Some Results

Some Results (Island Migration)

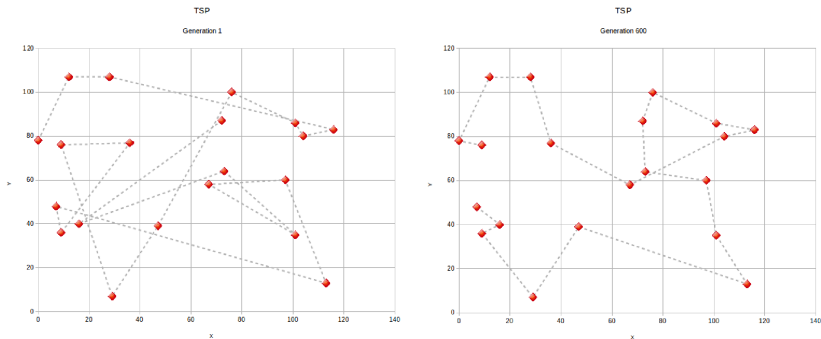

Figure :4 Islands - 150 Individuals - 2 Migrants - 70 Generations Epoch (≈ 5 Sec.)

Some Results (Island Migration vs. Sequential)

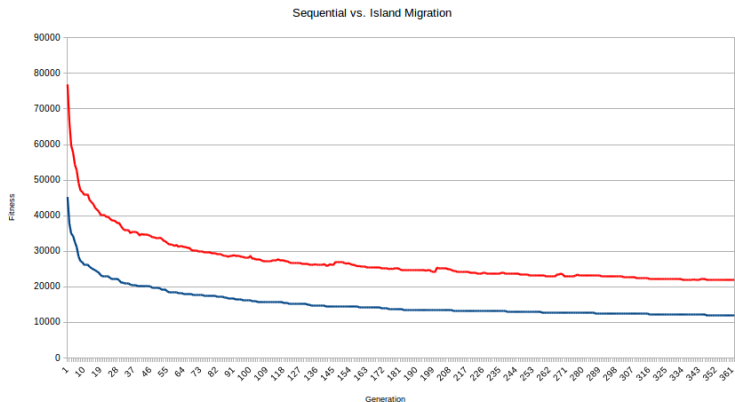

Figure :100 City - Sequential (150 Individuals) vs. 4 Islands (as before)

Future Work

Future Work

- ▶ More tests / Parameter improvements
 - ▶ intel i7 (8 cores x 4GHz) using 8 Islands
 - ▶ 5 times faster than sequential GA on same machine
- ▶ More debugging
 - ▶ bugs in Migration
 - ▶ lack of `.clone()`
 - ▶ ...
- ▶ Execution time differences based on number of Islands
