

Chapter 11: Pointers

Declaring Pointer Variables

- When a pointer variable is declared, its name must be preceded by an asterisk:
 - int *p;
- p is a pointer variable capable of pointing to *objects* of type int.
- We use the term *object* instead of *variable* since p might point to an area of memory that doesn't belong to a variable.

Chapter 11: Pointers

Using const to Protect Arguments

- We can use const to document that a function won't change an object whose address is passed to the function.
- $\ensuremath{\cdot}$ const goes in the parameter's declaration, just before the specification of its type: void f(const int *p)

```
{
  *p = 0; /*** WRONG ***/
}
```

Attempting to modify *p is an error that the compiler will detect. 31 Copyright © 2008 W. W. Norton & Comp All rights reserved.

CPROGRAMMING

Chapter 11: Pointers Pointers as Return Values • Functions are allowed to return pointers: int *max(int *a, int *b) if (*a > *b) return a; else return b; } • A call of the max function: int *p, i, j; p = max(&i, &j); After the call, p points to either i or j. **C**PROGRAMMING 32 Copyright © 2008 W.
