

Warning: These notes are not complete, it is a Skelton that will be modified/add-to in the class. If you want to us them for studying, either attend the class or get the completed notes from someone who did

## CSE2301

### Dynamic Memory Allocation and Structs

These slides are based on slides by Prof. Wolfgang Stuerzinger at York University

---

---

---

---

---

---

---

---

## Dynamic memory Allocation

- How to allocate memory during run time.
- `int x=10;`
- `int myarray[x];` That is not allowed in C

---

---

---

---

---

---

---

---

## malloc()

- In `stdlib.h`
- `void *malloc(int n);`
- Allocate memory at run time.
- Returns a pointer (to a void) to at least n bytes available.
- Returns null if the memory was not allocated.
- The memory are not initialized.

---

---

---

---

---

---

---

---

## calloc()

- void \*calloc(int n, int s);
- Allocates an array of n elements where each element has size s;
- calloc initializes memory to 0.

---

---

---

---

---

---

---

---

## realloc()

- What if we want our array to grow (or shrink)?
- void \*realloc(void \*ptr, int n);
- Resizes a previously allocated block of memory.
- ptr must have been returned from either calloc, malloc, or realloc.
- Array may be moved if it could not be extended in its current location.

---

---

---

---

---

---

---

---

## free()

- void free(void \*ptr)
- Releases the memory we previously allocated.
- ptr must have been returned by malloc, alloc, or realloc.

---

---

---

---

---

---

---

---

```
#include<stdio.h>
#include<stdlib.h>
main() {
    int *a, i,n,sum=0;
    printf("Input an array size ");
    scanf("%d",&n);
    a=calloc(n, sizeof(int));
    for(i=0; i<n; i++)    scanf("%d",&a[i]);
    for(i=0; i<n; i++) sum+=a[i];
    free(a);
    printf("Number of elements = %d and the sum is %d\n",n,sum);
}
```

---

---

---

---

---

---

---

---

**Trouble with Pointers**

- Overruns and underruns
  - Occurs when you reference a memory beyond what you allocated.
- Uninitialized pointers
- `int *x;`  
`*x=20;`

---

---

---

---

---

---

---

---

**Trouble with Pointers**

- Uninitialized pointers

```
main() {
    char *x[10];
    strcpy(x[1], "Hello");
}
```

---

---

---

---

---

---

---

---

### Trouble with Pointers

- Null-Pointers De-referencing

```
main() {
    int *x;
    int size;
    x=(int*) malloc(size);
    *x = 20; // What is wrong
}
```

---

---

---

---

---

---

---

---

### Trouble with Pointers

- A better way of doing it

```
x=(int *) malloc(size);
if(x == NULL) {
    printf(" ERROR ...\n");
    exit(1);
}
*x=20;
```

---

---

---

---

---

---

---

---

### Memory Leaks

- `int *x;`
- `x=(int *) malloc(20);`
- `x=(int *) malloc(30);`
- The first memory block is lost for ever.
- MAY cause problems (exhaust memory).

---

---

---

---

---

---

---

---

### Trouble with Pointers

- Inappropriately use freed memory
- `char *x;`
- `x=(char *) malloc(50);`
- `free(x);`
- `x[0]='A';` Does work on my system

---

---

---

---

---

---

---

---

### Trouble with Pointers

- Inappropriately freed memory
- `char *x=NULL;`
- `free(x);`
  
- `x=malloc(50);`
- `free(x+1);`
  
- `free(x)`
- `free(x)`

---

---

---

---

---

---

---

---

### Structures

- `struct {`
- `float width;`
- `float height;`
- `} chair, table;`
- chair and table are variables
- `struct { ... }` is the type

---

---

---

---

---

---

---

---

## Structures

- Accessing the members is done via . Operator
- `chair.width=10;`
- `table.height= chair.width+20;`
- Struct's can not be assigned
- `chair = table;`
- `&chair` is the address of the variable `chair` of type `struct {....}`

---

---

---

---

---

---

---

---

## Structures

- `struct dimension {`
- `float width;`
- `int height;`
- `};`
- Now, `struct dimension` is a valid type
- `struct dimension a, chair, table;`

---

---

---

---

---

---

---

---

## Structures

- Struct names have their own namespace separate from variables and functions;
- Struct member names have their own namespace.
- `struct dimension dimension;` ✓
- `struct dimension {`
- `float width;`
- `float height;`
- `} height;` ✓

---

---

---

---

---

---

---

---

## Structures

- You can pass structure as arguments for functions
- ```
float get_area(struct dimension d) {  
    return d.width * d.height;  
}
```
- This is a call-by-value, a copy of the structure is sent to the function

---

---

---

---

---

---

---

---

## Structures

- Structure can be returned from functions.
- ```
struct dimension make_dim(int width, int height) {  
    struct dimension d;  
    d.width = width;  
    d.height = height;  
    return d;  
}
```

---

---

---

---

---

---

---

---

## Structure Pointers

- ```
struct dimension table, *p;
```
- ```
p = &table;
```
- ```
*p.width
```

WRONG, . has a higher precedence
- ```
(*p).width;
```
- You can use
- ```
p->width;
```

---

---

---

---

---

---

---

---

## Structures

- It is inefficient to pass large structures to functions, instead use pointers and you can manipulate the same structure.

---

---

---

---

---

---

---

---

## Example

- #include <stdio.h>
- main() {
- struct { 111 11
- int len; 222 12
- int height;
- } tmp, \*p=&tmp;
- tmp.len=10;
- tmp.height=20;
- printf(" 111 %d \n",++(p->len));
- printf(" 222 %d \n",++p->len);
- }

---

---

---

---

---

---

---

---

## Linked List

- struct list {
- int data;
- struct list \*next;
- };
- It is O.K. to use a pointer to a struct that is declared but not defined

---

---

---

---

---

---

---

---

## Linked List

- Pointer head points to the first element
- Last element pointer is NULL

---

---

---

---

---

---

---

---

## Linked List

```
#include <stdio.h>
#include <stdlib.h>
main() {
    struct list {
        int len;
        struct list *next;
    } *head, *p, *last;
    head = (struct list *) malloc(sizeof(list));
    head->len = 1;
    head->next = NULL;
    last = head;
    int i;
    scanf("%d", &i);

    while(i >= 0) {
        scanf("%d", &i);
        p = (struct list *) malloc(sizeof(list));
        p->len = i;
        p->next = NULL;
        last->next = p;
        last = p;
    }
    printf("Enter the number you want to search for ");
    scanf("%d", &i);
    for(p = head; p != NULL; p = p->next)
        if(p->len == i)
            printf("FOUND \n");
}
```

---

---

---

---

---

---

---

---

## Delete a node

- void deleteit(dim \*\*p, int i) { p is a pointer to head (pointer to 1<sup>st</sup> element in list)
- // DOES NOT WORK 1<sup>st</sup> element
- dim \*\*p1, \*temp;
- p1 = p;
- while((\*p1)->num != i) p1 = &(\*p1)->next;
- temp = \*p1;
- \*p1 = (\*p1)->next; Debug it
- free(temp);
- }

---

---

---

---

---

---

---

---

## Array of Structures

- struct dimension {
- float width;
- float height;
- };
- struct dimension chairs[2];
- struct dimension \*tables;
- tables = (struct dimension\*) malloc  
(20\*sizeof(struct dimension));

---

---

---

---

---

---

---

---

## Initializing Structures

- struct dimension sofa={2.0, 3.0};
- struct dimension chairs[] = {
- {1.4, 2.0},
- {0.3, 1.0},
- {2.3, 2.0 };

---

---

---

---

---

---

---

---

## Nested Structures

- struct point {int x, int y};
- struct line {
- struct point a;
- struct point b;
- } myline;
- myline.a.x=0;
- myline.a.y=5;

---

---

---

---

---

---

---

---

## Structs

- `struct {float w,h;} chair;`
- `struct dim {float w,h;} chair1;`
- `struct dim {float w,h};`
- `struct dim chair2;`
- `typedef struct {float w,h;} dim;`
- `dim x,y;`

---

---

---

---

---

---

---

---

## typedef

- We can define a new type and use it later  

```
typedef struct {  
    int x,y;  
    float z;  
} newtype;  
newtype a1,b1,c1,x;
```
- Now, `newtype` is a type in C just like `int` and `float`

---

---

---

---

---

---

---

---

## Unions

- `union value {`
- `int i;`
- `char c;`
- `float f;`
- `};`
- Similar to `struct` but all variables share the same memory location, we access them differently
- `union value v;`
- `v.f=2.3; v.i=45; ....`

---

---

---

---

---

---

---

---

## Enumeration

- enum state {
- IN,
- OFF,
- }x;
- x=IN; if (x==OFF) { ... };
- Values starts at zero unless otherwise specified

---

---

---

---

---

---

---

---

## Enumeration

- enum my\_var {
- RED = 1,
- BLUE , /\* by definition 2 \*/
- GREEN = 16,
- YELLOW , /\* 17 \*/
- };

---

---

---

---

---

---

---

---
