

Listen

EECS 4315

www.eecs.yorku.ca/course/4315/

JPF and listeners

VMListener

```
public interface VMListener extends JPFLListener {  
    // VM has been initialized and, hence, classes  
    // have been loaded  
    void vmInitialized(VM vm);  
  
    // A number of methods related to the execution  
    // of instructions  
    void executeInstruction(VM vm,  
                           ThreadInfo currentThread,  
                           Instruction instructionToExecute);  
  
    void instructionExecuted (VM vm,  
                           ThreadInfo currentThread,  
                           Instruction nextInstruction,  
                           Instruction executedInstruction);  
    ...
```

VMListener

```
// A number of methods related to threads
void threadStarted(VM vm,
    ThreadInfo startedThread);
...
// Class has been loaded
void loadClass(VM vm,
    ClassFile classFile);

// A number of methods related to objects
void objectCreated(VM vm,
    ThreadInfo currentThread,
    ElementInfo newObject);
...
...
```

VMListener

```
// A number of methods related to garbage
// collection
void gcBegin(VM vm);
...

// A number of methods related to exceptions
void exceptionThrown(VM vm,
    ThreadInfo currentThread,
    ElementInfo thrownException);
...
```

VMListener

```
// A number of methods related to choice
// generators
void choiceGeneratorRegistered(VM vm,
    ChoiceGenerator<?> nextCG,
    ThreadInfo currentThread,
    Instruction executedInstruction);

...
// A number of methods about methods
void methodEntered(VM vm,
    ThreadInfo currentThread,
    MethodInfo enteredMethod);

...
}
```

Garbage collector

Write a listener that prints a * whenever the garbage collector is invoked by JPF.

Garbage collector

Write a listener that measures the amount of time (in milliseconds) JPF's garbage collector takes whenever it is invoked by JPF.

Bytecode instructions

Implement a listener which prints the mnemonics of the bytecode instructions that are executed by JPF.

Method invocations

Implement a listener which prints a method that is invoked most often by JPF and the number of times that it is invoked.
